Showing Up

Seven years on foot, told by my own data

Gerald Tesha

This edition covers every activity I logged on Strava from 17 August 2019 to 25 October 2026: 2,061 of them.

Every number in this book is computed from that log, and every chart is drawn from the same rows. Distance and climb count my four sports on foot: runs, walks, trail runs and hikes. Activity names and exact locations were removed before publishing.

This book is the website My Strava Journey set as one volume. On the site it is rebuilt from the data every time the page opens; the PDF is printed again whenever the data is refreshed, so each edition matches the site on the day it was made.

How the book was built is told in Annex A, and how to reach me is on the last page before the back cover.

ANNEX B About the data

Get in touch

Prologue

I uploaded my first activity on 17 August 2019: a 31 km ride. Over the next months I logged 62 outings, most of them runs on a treadmill. Then my log went quiet for 353 days, from July 2020 to June 2021.

When it came back, it didn’t stop again. Since June 2021 I’ve gone out on 1,435 of 1,947 days, and the longest break has been ten days. As this edition closes, my streak stands at 301 days in a row.

This book is that record, read back. It’s built from 2,061 activities and nothing else: 13,237 km on foot, 84,367 metres of climb and 2,382 hours on the move, across 7 countries and 17 regions of Tanzania. Every number is computed from my Strava log, and every chart is drawn from the same rows. Where the log can’t tell me why something happened, I say so.

It runs in five parts. The first is the habit as a whole. The second goes through it year by year. The third takes the work apart: my sports, my records and the places I went. The fourth is the long view, the timeline and my goals. The last part is what I think it all means.

The habit

The whole record at once: how often I go out, when, where and in what.

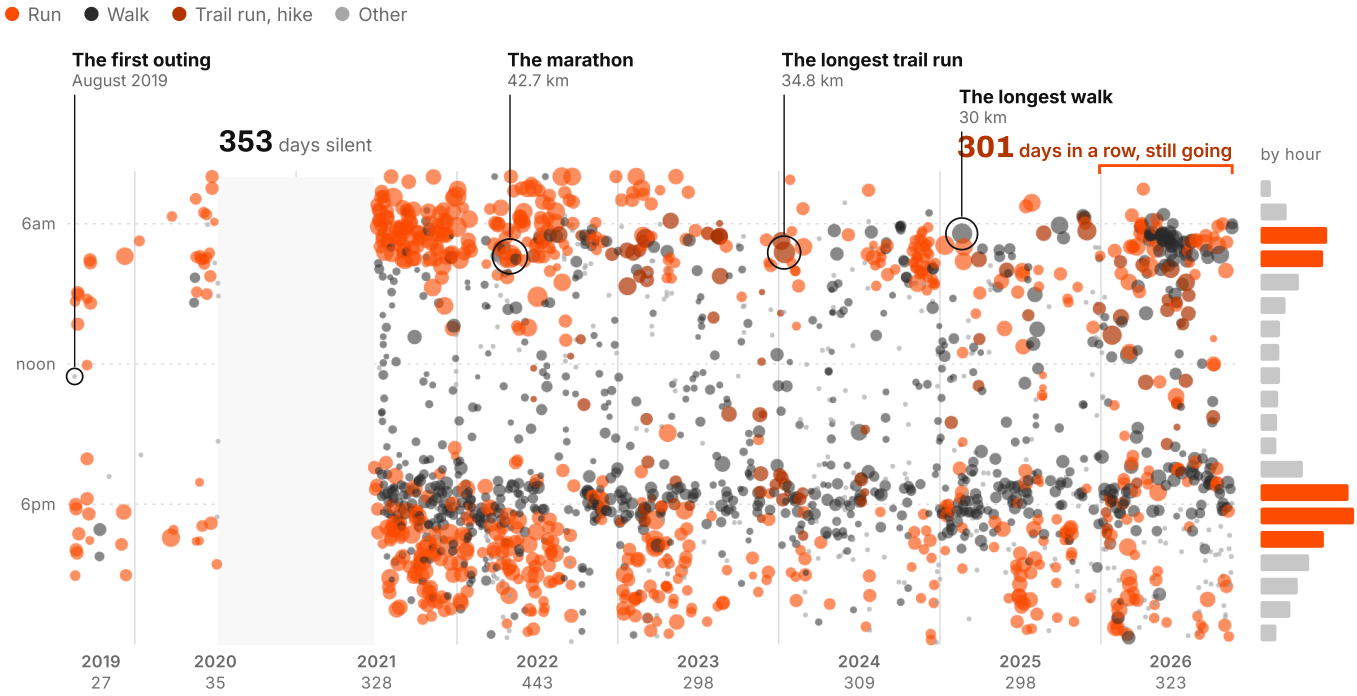

CHAPTER 1

01 The Journey

Seven years. One habit. The totals.

The whole habit at once: how the streak holds, how the distance spreads across my days, how each year was made, and six smaller things the data shows.

Every outing since August 2019, one dot each. Across is time, down is the hour it started, size is the distance on foot.

2,061
ACTIVITIES
on 1,485 separate days

13,237 km
ON FOOT
a third of the way around the Earth

84,367 m
CLIMBED
nine and a half times up Everest

301 days
CURRENT STREAK
unbroken, and still going

Most of my days on foot are small. My usual outing is 6 km, about an hour, a walk or an easy run. What adds up is how often it happens: I've done something on 57% of all days across 7 years, and as you read this my streak is 301 days deep.

OPEN A YEAR

2019 →

The quiet start

63% of my outings fell on a Saturday or Sunday, the most of any year. 85% were runs.

2020 →

The false start

69% of my outings began before 10 in the morning, the most of any year. Then my log stopped.

2021 →

The switch

Two a day: on 57% of my active days I went out more than once, the most of any year.

2022 →

The peak

Short and often: my average outing ran 56 minutes, the shortest of any year.

2023 →

The climb

I climbed 12 m for every km on foot, my steepest year, and ran 303 km on trails.

2024 →

The passport

6 countries in one year, and half my outings done in under 35 minutes.

2025 →

The long walk

Walks were 47% of my outings, the most of any year, and I did my longest walk on record, 30 km.

2026 →

Unbroken

One outing a day, and longer: 98 minutes on average. Only 8% of my days doubled up.

Keeping beats restarting.

Every day I go out makes the next one more likely. Every day off makes coming back harder.

Once I've been out today, there's an 82% chance I go out tomorrow. After a week in a row it's 95%, and after three weeks 99%. If I stop for five days, it drops to 33%. That's the pattern in my log: a streak is easier to keep going than to start again.

CHANCE THE NEXT DAY IS ACTIVE

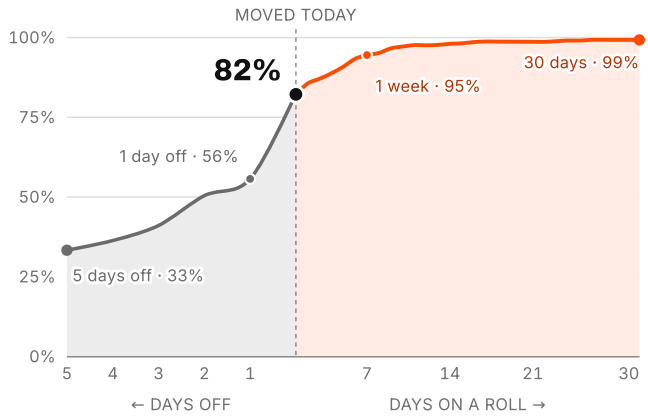

33%
after five days off

56%
after one day off

82%
after a day out

95%
after a week on a roll

THE ODDS, DAY BY DAY

How to read it. The dashed line is a day I went out. Each step right is one more day in a row; each step left is one more day since I last went out. The orange line climbs and flattens near 99%. The grey line drops fast: a single day off already brings the odds down to 56%.

GIVEN TODAY, THE CHANCE OF TOMORROW

	TOMORROW YOU MOVE	TOMORROW YOU REST
If you moved today	82%	18%
If you rested today	50%	50%

Why it holds. Each row adds up to 100%. Those two numbers, 82% after a day out and 50% after a day off, predict that 74% of days should be active in the long run. Since 2021, 74% of my days were. Before the habit caught, a day out led to another only 35% of the time.

Source: Activity Log · every day marked active or rest, measured since the habit caught in 2021

WHO DOES THE WORK

The busy days do the work.

The busiest tenth of days carry 25% of the distance.

If I line up all 1,316 of my days on foot from shortest to longest, the busiest tenth, every day over 20 km, carries 25% of my 13,237 km. That's as much as my quietest half put together. The big days matter, yet no handful of them makes the record: my 13 biggest days carry under 4%.

SHARE OF ALL DISTANCE ON FOOT

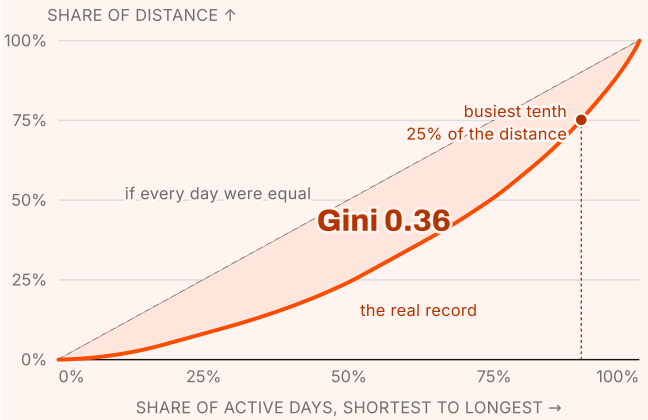

24% the quietest half of days

42% the busiest fifth of days

25% the busiest tenth of days

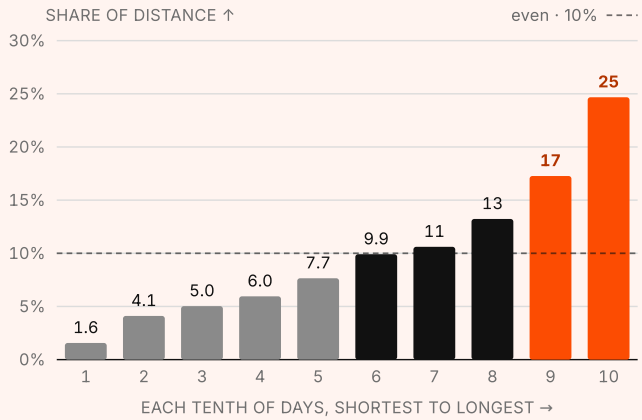

4% the 13 biggest days

EVERY DAY, ADDED UP

How to read it. Days run left to right from shortest to longest, and the line adds up their distance as it goes. If every day were the same length it would follow the dashed diagonal. The shaded gap is the Gini coefficient, one number for how uneven a split is: 0 means every day equal, 1 means a single day did everything. Here it is 0.36.

EACH TENTH OF DAYS, BY ITS SHARE

Why it matters. In an even record each tenth would carry 10%. The shortest tenth carries 1.6%, the longest 24.7%. Days of 10 km or more are 635 of the 1,316, under half, and they carry 74% of the distance. The short days keep my habit going; the long ones build the kilometres.

Source: Activity Log · daily distance on foot (run, walk, trail run, hike), 1,316 days

The time per day held.

What changed is how I split that time between outings.

On a day when I'm out, my time moving has hardly changed: between 79 and 106 minutes in every year. What changed is how I split it. In 2021, 57% of my active days had two or more outings, and the average outing ran 58 minutes. In 2026 it's mostly one outing a day: 8% of days double up, and the average outing runs 98 minutes.

HOW THE DAYS WERE SPLIT

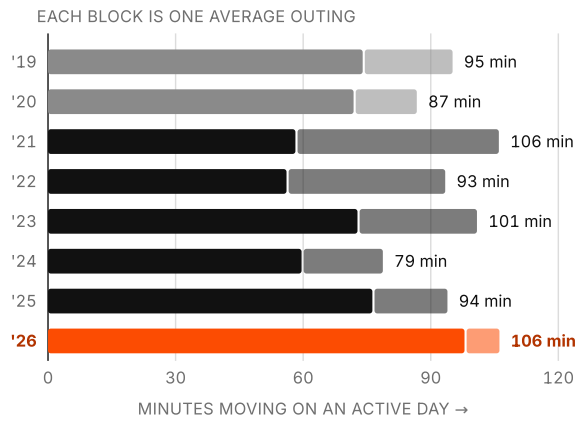

57%
of active days doubled up in 2021

8%
of active days doubled up in 2026

58 min
the average outing in 2021

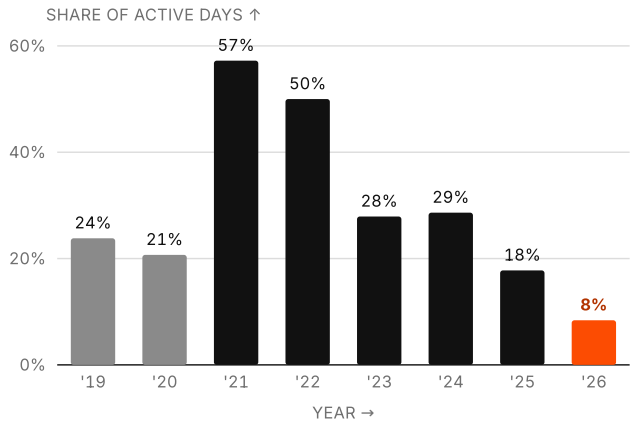

98 min
the average outing in 2026

A TYPICAL ACTIVE DAY, YEAR BY YEAR

How to read it. Each row is one year. The bar is the minutes moving on an average active day, and each block inside it is one average outing. Short blocks side by side mean days of doubles. One long block means a single long outing.

DAYS WITH TWO OR MORE OUTINGS

Why it matters. The time I give it each day has held steady from the first year to now. What changed is the shape of my day: from two shorter outings to one longer one.

Source: Activity Log · moving time and outings per active day, by year

Two regions do the climbing.

Two regions of Tanzania hold 63% of the metres climbed.

1,082 of my 1,155 outings with a GPS start point are in Tanzania, 94%. The other 73 are spread over 6 countries, 75% of them in Kenya and Malawi. Inside Tanzania, Dodoma is where I go out most, but my climbing happens somewhere else: Kilimanjaro and Morogoro hold 29% of my outings and 63% of the metres I've climbed.

WHERE THE OUTINGS HAPPEN

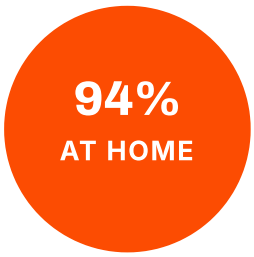

94%
of located outings are in Tanzania

6%
abroad, across 6 countries

29%
of Tanzania's outings are in Kilimanjaro and Morogoro

63%
of Tanzania's climbing is there

HOME AGAINST AWAY

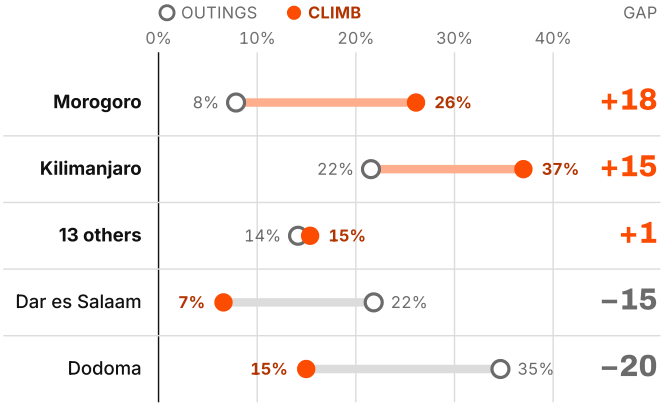

Tanzania · 1,082 activities

Kenya	32	2020
Malawi	23	2024
South Africa	13	2024
Rwanda	2	2024
Other	3	

INSIDE TANZANIA: SHARE OF OUTINGS AND OF CLIMB

How to read it. Only outings with a GPS start point can be placed; treadmill sessions and other indoor work cannot, so 906 outings sit outside this view. The disc is Tanzania. The list is every other country, with the year it was first reached.

Why it matters. Each row is a region. The grey ring is its share of the outings in Tanzania, the orange dot its share of the climb, and the number on the right is the gap in percentage points. Rows run from the biggest climb surplus to the biggest shortfall. Dodoma is my everyday ground, and it's flat by comparison. The metres come from my trips to the mountains.

Source: Strava GPS start points · countries and Tanzania regions, distance and climb on foot

Walks took over.

I've walked more often than I've run every year since 2022.

Of my 2,061 outings, 855 are walks and 782 are runs. Trail runs and hikes add 93, and everything off my feet is 16%. My walks overtook my runs in 2022 and have stayed ahead every year since.

SHARE OF ALL OUTINGS

41% walks

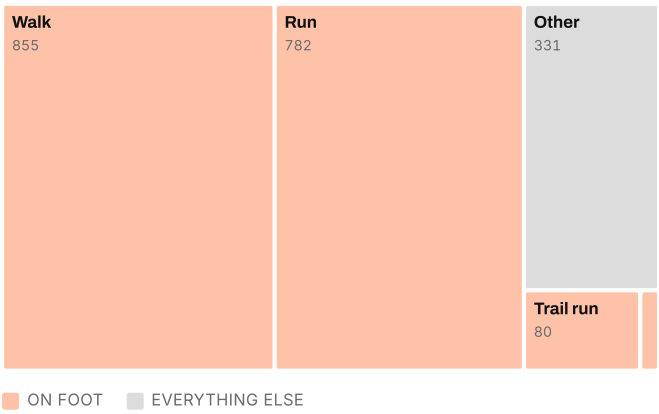

38% runs

5% trail runs and hikes

16% other activities, off the feet

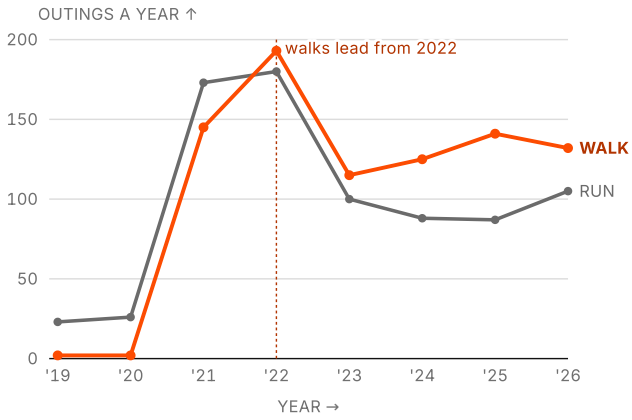

EVERY OUTING, BY SPORT

15 sports in all, yet **84%** of every outing is on foot.

How to read it. Each tile is a sport, sized by how many outings it has. The four sports on foot are named; everything else, from bikes to the gym, folds into one tile.

WALKS AGAINST RUNS, YEAR BY YEAR

Why it matters. Running carried my first years. Walking took over once the habit set in and has led since. Trail runs are counted on their own, so they are not in the run line. 2026 is still in progress.

Source: Activity Log · outings by sport type

Both ends of the working day.

I fit most outings in early in the morning or in the evening.

If I sort every outing by the hour it began, 44% start between 4 and 9 in the evening, with 6pm the busiest hour. Another 31% start before 10 in the morning. The middle of the day, 10am to 4pm, holds just 14%. My week is flatter: the quietest day still has 77% of the busiest day's outings.

WHEN OUTINGS START

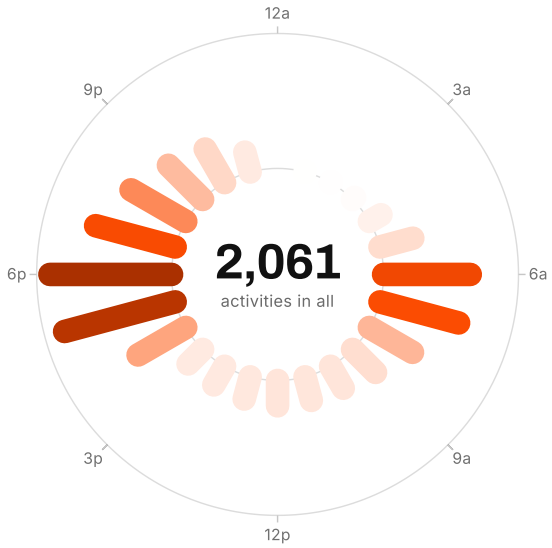

31% before 10 in the morning

14% between 10am and 4pm

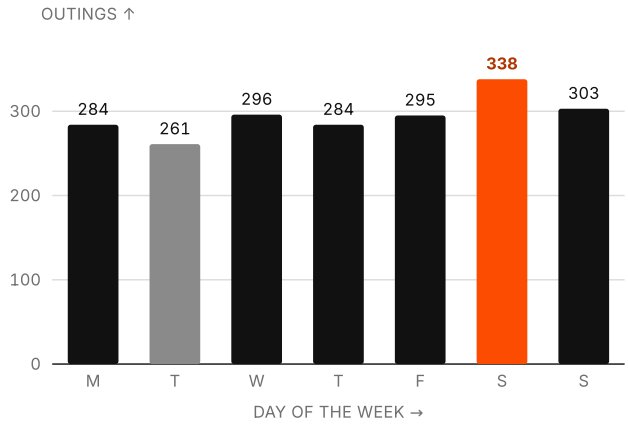

44% between 4 and 9pm

11% after 9pm

EVERY OUTING, BY THE HOUR IT BEGAN

EVERY OUTING, BY DAY OF THE WEEK

How to read it. Midnight is at the top and the hours run clockwise. Each spoke is one hour; the longer and darker it is, the more outings started then. The two bulges are early morning and evening.

Why it matters. Saturday is the busiest day and Tuesday the quietest, but the gap is small. I fit my outings around the working day, morning or evening, on every day of the week.

Source: Activity Log · start hour and weekday of every outing

Two thin months.

August and September are the quietest months of the year.

Take my four full years since the habit caught, 2022 to 2025, and count the days I was active in each month. Across the year it's 66%. January is my strongest month at 76%. August and September are the weakest, 52% and 47%. Every other month sits between 63% and 74%.

SHARE OF DAYS ACTIVE, 2022 TO 2025

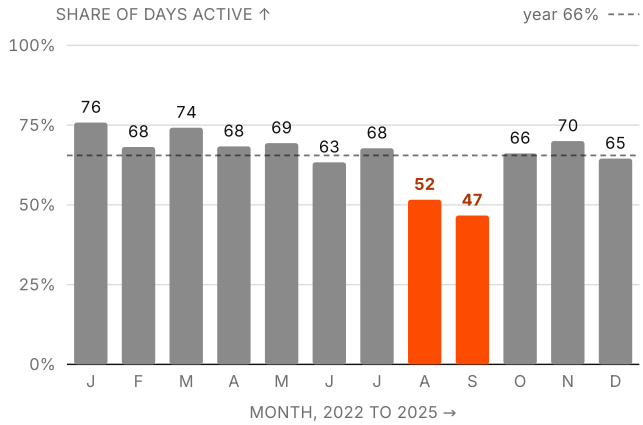

76%
in January, the strongest month

68%
in a typical month

52%
in August

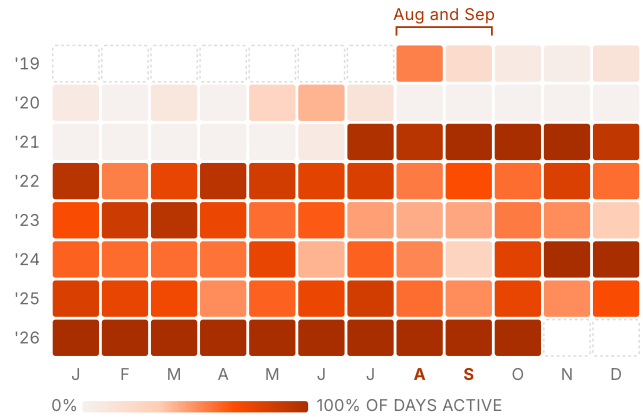

47%
in September

SHARE OF DAYS ACTIVE, BY MONTH

How to read it. Each bar is the share of that month's days with at least one activity, added up over the full years. The dashed line is the whole year. Orange marks the two weakest months.

EVERY MONTH OF THE RECORD

Why it matters. The dip is in every one of the four full years: both months fall below that year's own share. My log doesn't say why, and I won't guess. In 2026 the streak has filled them too.

Source: Activity Log · days with at least one activity, by month

The treadmill is fading.

It has always been a running habit, and I use it less and less.

In 2019, 63% of my sessions were indoors. So far in 2026 it's 16%. Nearly all my indoor time is running: 80% of my runs were on a treadmill, against 2% of my walks. Of the 8,288 km I've run, 6,905 km were indoors.

SHARE OF SESSIONS INDOORS

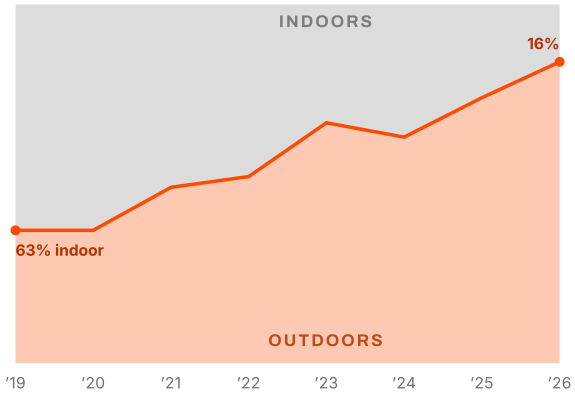

63%
of sessions in 2019

16%
of sessions in 2026

80%
of all runs

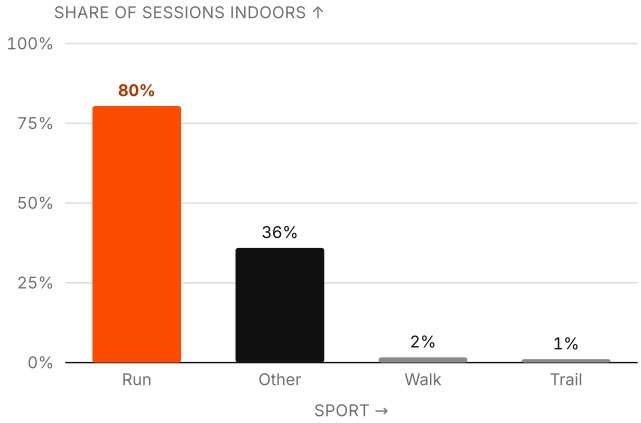

2%
of all walks

INDOORS AND OUTDOORS, YEAR BY YEAR

How to read it. Each year is split into indoor and outdoor sessions, stacked to 100%. The orange line is the waterline: outdoors below it, indoors above. Indoor means Strava marked it as a trainer session: a treadmill, a bike stand or the gym.

SHARE INDOORS, BY SPORT

Why it matters. My walks, trail runs and hikes happen outside. Running is the one I took indoors, so the fall in indoor share is my running moving outside, onto roads and trails.

Source: Activity Log · trainer flag on each session

Two jobs on foot.

Running owns the distance. Walking owns the vertical.

Running is 63% of my kilometres on foot and only 14% of my climb, because most of it is flat, on a treadmill. Walking is 30% of the kilometres and 43% of the climb. Trail runs and hikes are 7% of the distance and carry 44% of the climb.

SHARE OF DISTANCE AND CLIMB ON FOOT

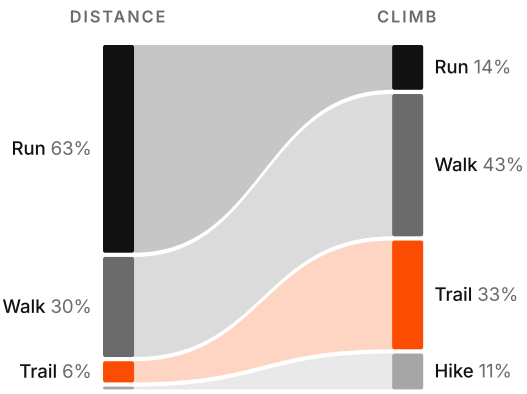

63%
of the distance is running

14%
of the climb is running

43%
of the climb is walking

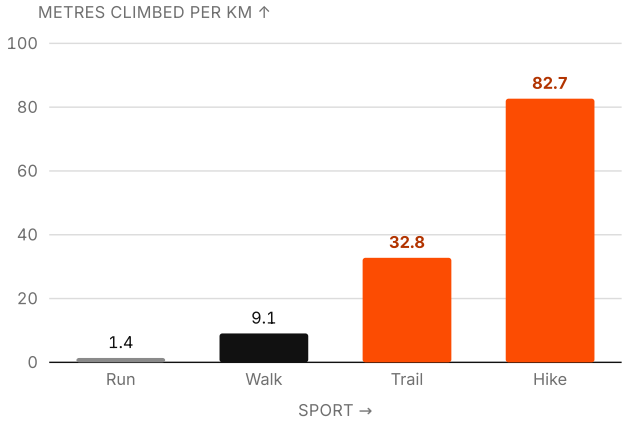

44%
of the climb is trail runs and hikes

DISTANCE AGAINST CLIMB, BY SPORT

How to read it. The left column splits all the distance on foot by sport, the right column splits all the climb. Each ribbon joins one sport's two shares. Running is thick on the left and thin on the right.

METRES CLIMBED PER KILOMETRE

Why it matters. A kilometre of hiking climbs 83 m, a trail run 33 m, a walk 9 m and a run 1.4 m. The height in my record was earned slowly, uphill, on foot.

Source: Activity Log · distance and climb on foot (run, walk, trail run, hike)

FROM THE LOGBOOK

> “Train, train, train. And when you think you have trained enough, keep training.”

JODY MITIC

II

Year by year

Each year read on its own, from the first quiet months to the year with no day off.

CHAPTER 2

02 Year in Sport

One year at a time.

Each year from 2019 to 2026 as its own report: the months, how I moved, when, every day of the year, the typical outing, the maths, the biggest days and where it happened.

2019

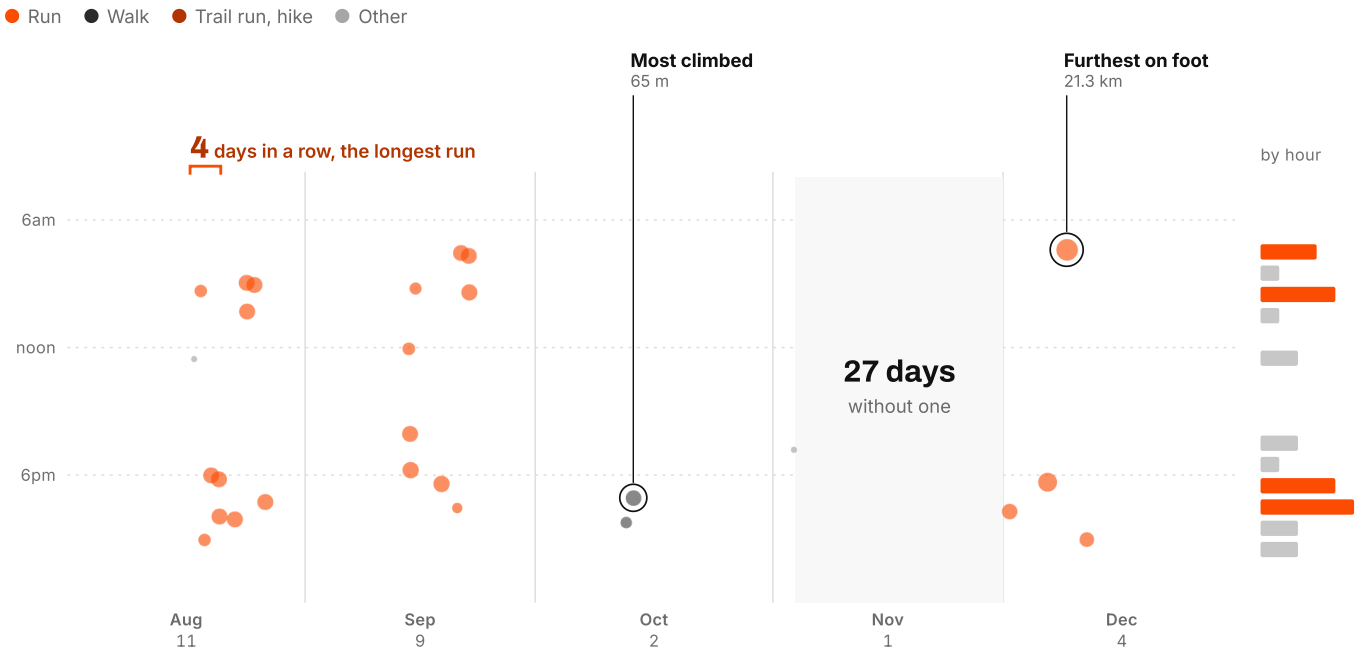

The quiet start.

This is where my log starts. I logged 27 activities, 23 of them runs, most of those on a treadmill. I covered 231 km on foot that year, and my longest run of days in a row was 4. Everything after this gets measured against it.

2019 IN FOUR NUMBERS

27	231 km	85 m	33 h
outings	on foot	climbed	moving

Every outing of 2019, one dot each. Across is the year, down is the hour it started, size is the distance on foot.

Source: Activity Log · every outing of 2019, placed by date and start time

August was the busiest.

I went out in every month. August was my busiest, with 11 outings and 90 km on foot. November was the quietest, with 1. My kilometres added up to 231, about 46 a month.

2019 BY THE MONTH

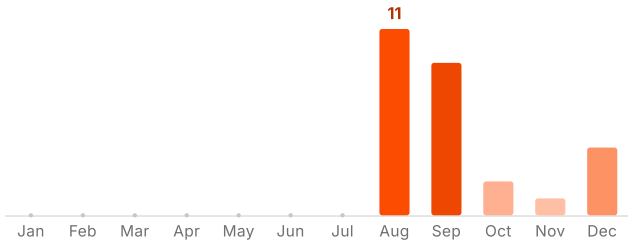

11
outings in August, the busiest

1
in November, the quietest

5
outings in an average month

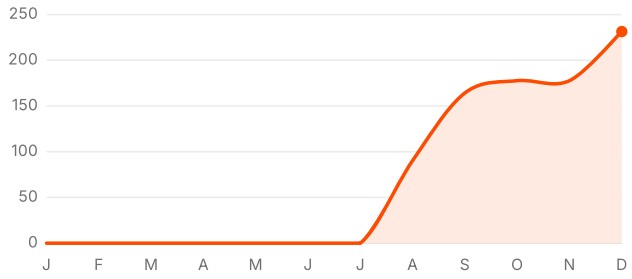

46 km
on foot in an average month

OUTINGS, MONTH BY MONTH

How to read it. One bar per month, taller and darker where more outings were logged. The labelled bar is the busiest month.

THE KILOMETRES ADDING UP

Why it matters. The line adds up every kilometre on foot as the months pass. Steep stretches are busy weeks, flat ones are quiet weeks or gaps.

Source: Activity Log · outings and distance on foot, by month

Runs led 2019.

I logged 23 of them, against 2 walks.

Of my 27 outings, 2 were walks, 23 runs and 0 trail runs or hikes, and 2 were off my feet. On foot, running covered 94% of my distance and walking carried the most climb, 100% of it.

SHARE OF ALL OUTINGS

7%
walks

85%
runs

0%
trail runs and hikes

7%
other activities, off the feet

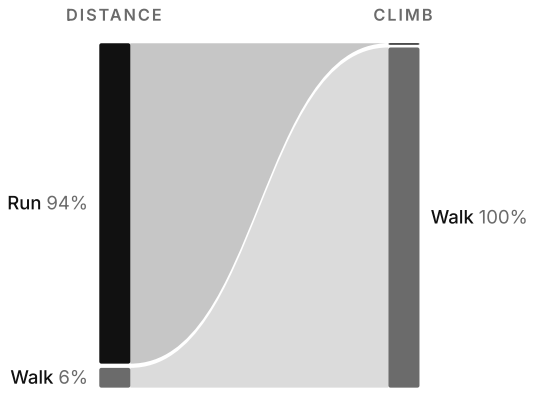

EVERY OUTING, BY SPORT

4 sports in all, yet **93%** of every outing is on foot.

How to read it. Each tile is a sport, sized by how many outings it had. Everything off the feet folds into one tile.

DISTANCE AGAINST CLIMB, ON FOOT

Why it matters. The left column splits the distance on foot by sport, the right column splits the climb. A sport that is thin on the left and thick on the right climbs far more than it covers.

Source: Activity Log · outings by sport, distance and climb on foot

The evenings led.

52% of my outings started between 4 and 9pm.

My busiest hour in 2019 was 7pm. 30% of my outings started before 10 in the morning, 11% between 10am and 4pm and 52% between 4 and 9pm. Sunday was my busiest day of the week with 9, Thursday the quietest with 1.

WHEN OUTINGS STARTED

how far out the longest outing sat

DISTANCE ON FOOT, WEEK BY WEEK

How to read it. One bar per week. Orange weeks beat the average week, grey ones fell short of it. With no rest days to count, the weekly distance is where the year's ups and downs show.

THE LONGEST OUTING AGAINST ALL THE OTHERS

Why it matters. The bars are every outing on foot, by distance. The grey band is one standard deviation either side of the average, the typical distance from it. The orange mark is the longest outing, counted in those deviations.

Source: Activity Log · daily active series, weekly and per-outing distance on foot

The biggest days of 2026.

My furthest outing on foot was 31.0 km in Apr 2026. The most I climbed in one outing was 935 m. I set 121 personal records, and my climbing added up to 2.2 times the height of Everest.

HOME AGAINST AWAY

INSIDE TANZANIA: SHARE OF OUTINGS AND OF CLIMB

How to read it. Only outings with a GPS start point can be placed; treadmill sessions cannot. The disc is Tanzania, the list is every other country reached.

Why it matters. Each row is a region: the grey ring is its share of the outings, the orange dot its share of the climb. Rows run from the biggest climb surplus to the biggest shortfall.

Source: Strava GPS start points · countries and Tanzania regions

Third of 8 years.

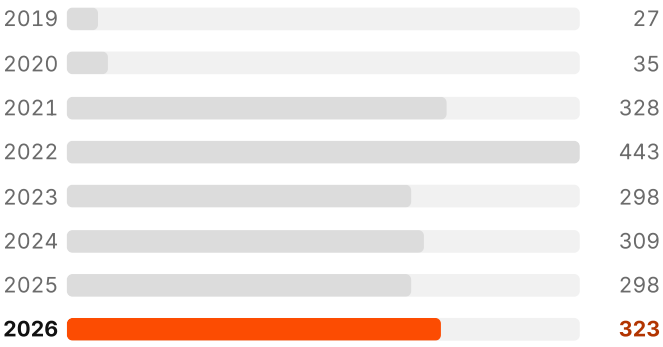

2026 ranks third of 8 years for outings.

By outings 2026 is my third year, by distance on foot my third, and by climb my second of eight. Against 2025 I had 8% more outings, 51% more distance and 19% more climb. 2026 is still running, so it is measured against full years.

2026 AGAINST 2025

CHAPTER 3

03 Sports

What the work is made of

My four sports on foot, taken apart. Every run, walk, trail run and hike I've logged, compared on distance, pace, climb, hours, the time of day, the long days, the effort and the crowd. I keep the treadmill apart from the road because in my log it behaves like a sport of its own.

FOUR SPORTS ON FOOT

Runs go far. The rest climb.

Runs covered 63% of the distance. Walks, trails and hikes did 86% of the climbing.

Of my 2,061 outings, 1,730 were on foot: 782 runs, 855 walks, 80 trail runs and 13 hikes. Together they covered 13,237 km and climbed 84,367 m over 2,105 hours moving, on 1,316 different days. My running splits in two: 629 runs on a treadmill and 153 outdoors. The two behave like different sports, so I keep them apart on this page.

THE FOUR SPORTS ON FOOT

Source: Activity Log · every run, walk, trail run and hike, placed by pace and by climb per kilometre

1 · WHO DOES WHAT

Walks took more hours.

More hours than runs, for less distance.

My runs and walks are close in number (782 against 855) and in hours moving (919 against 945), but a typical run of mine went 2.5 times as far: 10.1 km at the median against 4.0 km. Trail runs are 5% of my outings and 33% of my climb. My 13 hikes add 11% of the climb from under 1% of the distance.

EACH SPORT'S BIGGEST SHARE

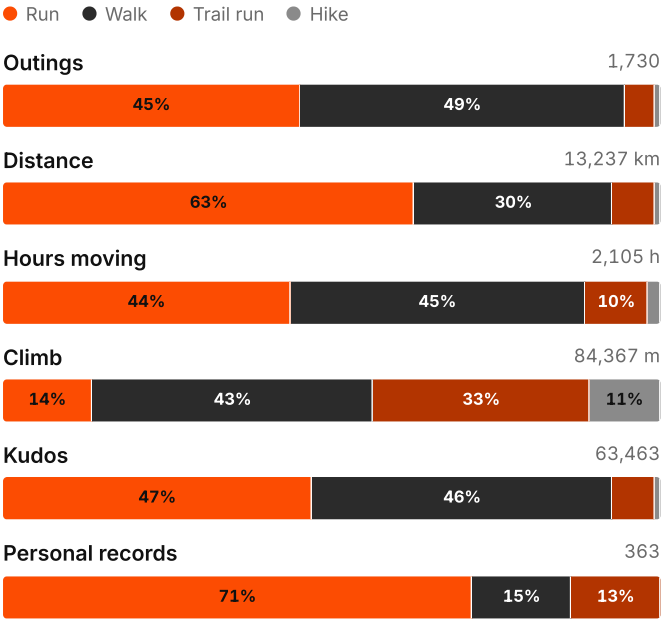

63% of the distance was run

45% of the hours were walked

33% of the climb came on trail runs

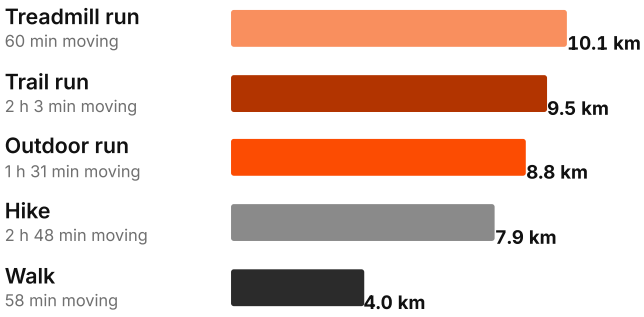

11% of the climb came on 13 hikes

EACH SPORT'S SHARE OF THE RECORD

How to read it. Each bar is one measure, cut into the four sports' shares of it. Read down a colour to see one sport rise and fall from measure to measure.

THE TYPICAL OUTING OF EACH

Why it matters. The median outing, the one in the middle when all are lined up by distance. My typical walk is short; the long walks sit further out.

Source: Activity Log · runs, walks, trail runs and hikes; distance and climb on foot only

In 2026, walks went further.

For the first time, walks covered more distance than runs.

Running carried my record for years: 2,402 km in 2021 against 473 km of walking. Since then my running has fallen to 1,065 km in 2026 so far while my walking has grown to 1,099 km, 2.3 times its 2021 total. My trail running, counted on its own here, peaked in 2023 with 303 km.

2026 SO FAR, AGAINST THE RUNNING PEAK

1,099 km
walked in 2026 so far

KILOMETRES ON FOOT, YEAR BY YEAR

How to read it. One column a year, cut by sport, with the total on top. The star marks 2026, still running.

WALKING AGAINST RUNNING

Why it matters. Runs here are road and treadmill runs; trail runs are counted on their own. The dashed line marks the year the walking line crossed the running one.

Source: Activity Log · distance on foot by sport and year

83% of running was indoors.

I ran those kilometres on a treadmill, without leaving the room.

629 of my 782 runs were on a treadmill, 6,905 km in all. In 2021, 95% of my running kilometres were indoors; 2026 was the first year under half, at 45%. The treadmill also leaves a fingerprint in my log: 45% of my treadmill runs stopped within 100 m of a whole 5 km, and 61% within 100 m of a whole kilometre, against 36% of outdoor runs.

RUNNING INDOORS

RUNNING KILOMETRES, INDOORS AND OUT

How to read it. Running kilometres each year, the treadmill in light orange and outdoors in deep orange. The figure on top is the indoor share.

WHERE THE TREADMILL STOPPED

Why it matters. One bar per kilometre. My runs pile up at 5, 10, 15 and 21 km: on a treadmill I stop when the display says so.

Source: Activity Log · runs marked as treadmill (trainer) against runs outdoors

Each sport has its pace.

A treadmill kilometre took 5:56. A walking one took 14:40.

Pace here is minutes moving for each kilometre, the middle value of all my outings: treadmill 5:56, outdoor run 11:55, trail run 12:40, walk 14:40 and hike 20:21. Outdoors, my typical run took 2.0 times as long per kilometre as on the treadmill, nearer a walk than a treadmill run. On the treadmill my quickest year was 2021 at 5:05; 2026 so far sits at 5:44.

MEDIAN MINUTES PER KILOMETRE

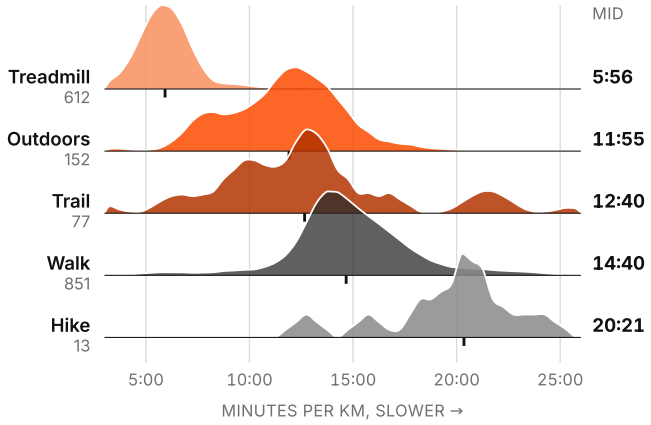

5.9 min
a treadmill km

11.9 min
an outdoor run km

of 2026 walks under 3 km

EVERY WALK BY DISTANCE, YEAR BY YEAR

How to read it. One ridge a year, its height the share of walks at each distance. The ridge slides right as the walks grow; 2026 is in orange.

SHARE OF WALKS UNDER 3 KM

Why it matters. Half my walks used to be short ones. In 2026 almost every walk is an outing of its own.

Source: Activity Log · walks, indoor and outdoor

Long days moved outdoors.

They started on the treadmill. 83 outings reached a half marathon.

A half marathon is 21.1 km. Up to 2022 I did 46 outings that long, every one of them on a treadmill. In 2026 so far I've done 15, and 12 of them were outside: 5 outdoor runs, 3 trail runs and 4 walks. My longest of all was 42.7 km on a treadmill in May 2022, a marathon indoors.

OUTINGS OF 21.1 KM OR MORE, YEAR BY YEAR

How to read it. Each column counts the year's outings of 21.1 km or more, coloured by how they were done.

THE LONGEST OF EACH

Why it matters. Every way I move except the hike has gone past 30 km at least once. My longest hike was 18.4 km, but it climbed 952 m on the way.

Source: Activity Log · outings of 21.1 km or more by way of moving

Hikes climb the most.

Hikes climbed 83 m for every kilometre. Walks climbed 9.

Spread over every kilometre I covered in each: hikes 83 m, trail runs 33 m, walks 9 m, outdoor runs 8 m and the treadmill none. That's why my walks, with 30% of the distance, did 43% of the climbing, and why my eight biggest climbs were all hikes and trail runs. The biggest was 1,979 m on a hike of 16.1 km in Mar 2025.

METRES CLIMBED FOR EACH KILOMETRE

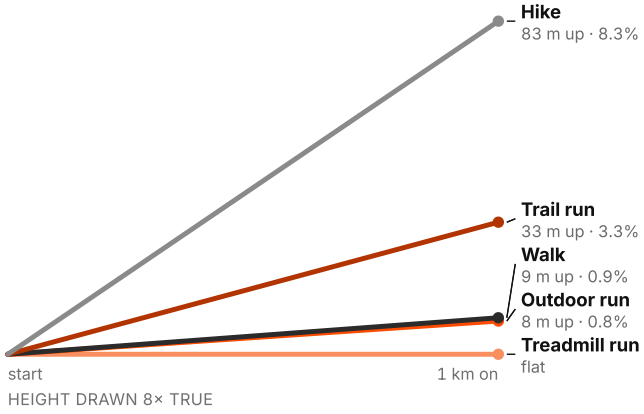

83 m
per km on a hike

33 m
per km on a trail run

per km on a walk

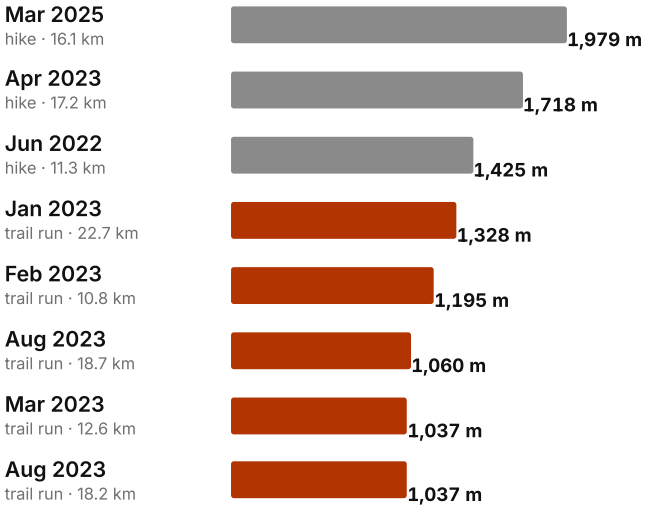

1,979 m
climbed in one outing, the most

IF EACH SPORT WERE A ROAD

How to read it. Each line climbs across one kilometre at that sport's average gradient. The rise is drawn taller than true so the gentle ones can be told apart; the figures are the true ones.

THE EIGHT BIGGEST CLIMBS

Why it matters. My single biggest days of climbing, coloured by sport. None of them was a walk or a road run.

Source: Activity Log · elevation gain on foot over distance on foot

The treadmill runs at night.

37% of my treadmill runs started after 8pm or before 5am.

Each way I move keeps its own hours. My treadmill runs peak at 7am and again from 7pm to midnight, 43% of them in that late stretch. My walks peak at 5pm, with 48% between 4 and 7pm. My outdoor runs start at 6am or in the late afternoon. Trail runs and hikes are my weekend sports: 63% and 69% fell on a Saturday or Sunday, against 25% of treadmill runs, when an even week would give 29%.

HOURS AND DAYS

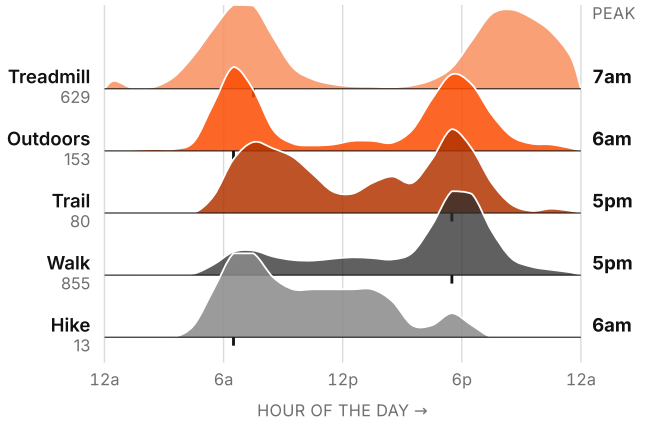

37%
of treadmill runs after 8pm or before 5am

48%
of walks between 4 and 7pm

63%
of trail runs at the weekend

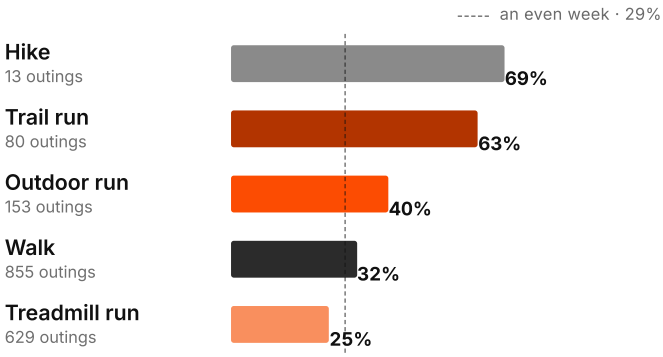

25%
of treadmill runs at the weekend

THE HOUR EACH OUTING STARTED

How to read it. One ridge per way of moving, its height the share of outings starting at each hour from midnight to midnight. The tick and the figure on the right mark the busiest hour.

SHARE OF EACH ON A SATURDAY OR SUNDAY

Why it matters. Bars past the dashed line lean to the weekend. The trails need a free morning; the treadmill fits into any evening I have.

Source: Activity Log · local start hour and weekday of every outing on foot

199 run-and-walk days.

Days when I both ran and walked. The two were usually hours apart.

I ran first on 130 of the 199 days (65%). From the end of the first outing to the start of the second, the median gap was 6 h 28 min; only 14 pairs were under half an hour apart, while 89 were 8 hours or more apart, a morning run and an evening walk. Most of these days came in 2021, 87 of them; 2026 so far has 11.

DAYS WITH BOTH

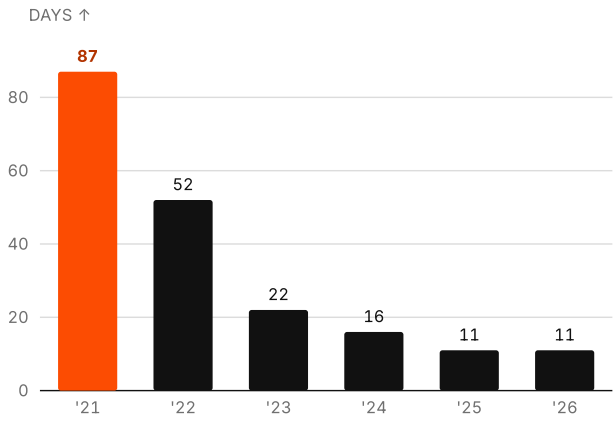

199 days
with a run and a walk

65%
of them with the run first

6.5 h
between them, the median

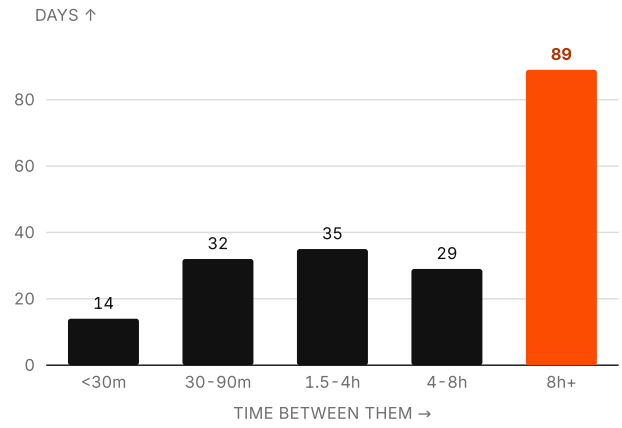

87 days
in 2021, the most

DAYS WITH A RUN AND A WALK, YEAR BY YEAR

How to read it. Each bar counts the days in that year with at least one run (or trail run) and at least one walk.

TIME BETWEEN THE TWO

Why it matters. My walk was rarely a cool-down. Most pairs were two separate outings, one at each end of the day.

Source: Activity Log · start time and moving time of runs and walks on the same date

Treadmill runs work hardest.

Per hour, treadmill runs scored 47 on effort and walks 17.

Relative effort is Strava's score of how hard my heart worked, built from heart rate. Counted per hour moving, the order is treadmill runs (47), outdoor runs (39), trail runs (26) and walks (17). Hikes are left out: too few carry a score. The people who follow me answer differently: my trail runs drew 51 kudos each, the most of any. My outdoor runs set 1.5 personal records per outing, while the treadmill sets almost none (0.04), because Strava's segment records need GPS.

EFFORT PER HOUR, KUDOS AND RECORDS PER OUTING

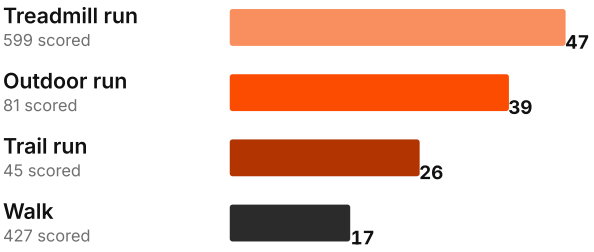

47
effort per hour, treadmill run

17
effort per hour, walk

51
kudos per trail run

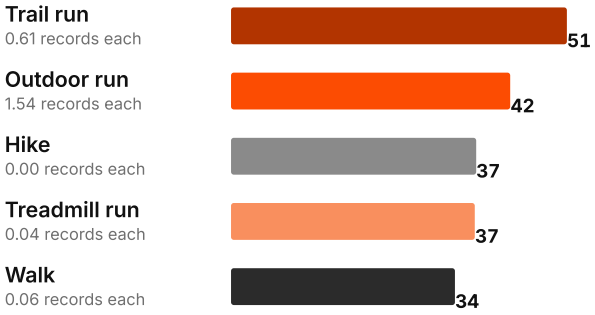

1.5
personal records per outdoor run

RELATIVE EFFORT PER HOUR MOVING

How to read it. The sum of every scored outing's relative effort, divided by the hours they took. Higher means harder on the heart for each hour out.

KUDOS PER OUTING

Why it matters. Kudos are the likes other athletes give. The small figure under each sport is how many personal records it sets per outing.

Source: Activity Log · Strava relative effort (heart rate), kudos and personal records

Longer runs, quicker km.

The longer the treadmill run, the quicker each kilometre.

A correlation measures how two things move together, from −1 to 1, with 0 meaning no link. Across my 606 treadmill runs, distance against pace gives −0.43: a moderate pull, with my longer runs going quicker. The fitted line takes 5 seconds off each kilometre for every extra kilometre run. My typical 5 km went at 6:28 a km, my typical 21 km at 5:18, 69 seconds quicker. My running and walking didn't trade off: week by week since 2021 the two give 0.08, close to none, so a big running week didn't mean less walking.

FOUR NUMBERS FROM THE FITS

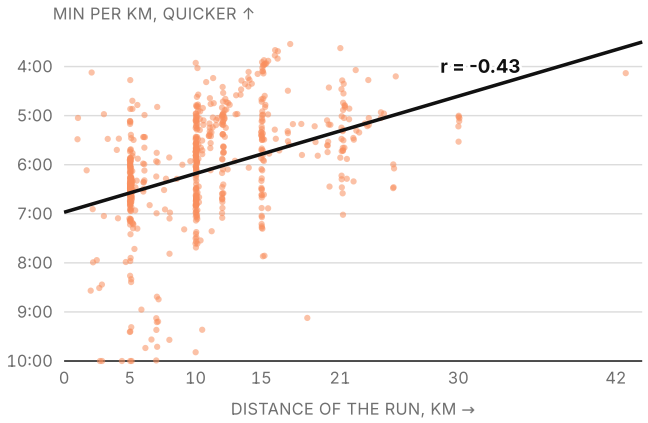

−0.43
treadmill distance against pace

5 s
quicker per km for each extra km

69 s
per km quicker at 21 km than at 5 km

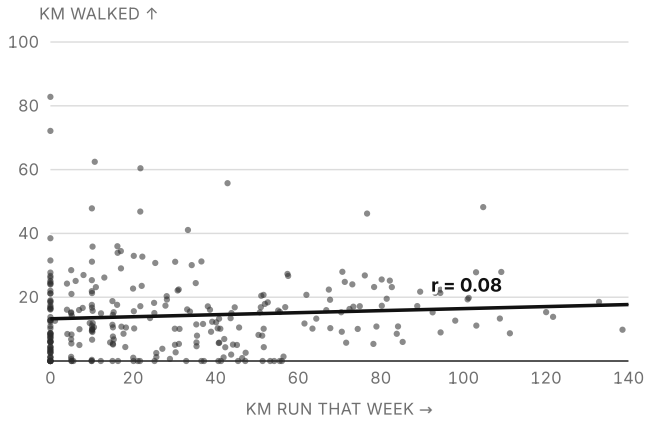

0.08
weekly running km against walking km

TREADMILL RUNS: DISTANCE AGAINST PACE

How to read it. One dot per treadmill run, quicker at the top. The black line is the straight line that fits the dots best; it falls to the right, so longer runs ran quicker.

EACH WEEK: KILOMETRES RUN AGAINST WALKED

Why it matters. One dot per week since 2021. The fitted line is nearly flat: how far a week ran says almost nothing about how far it walked.

Source: Activity Log · least-squares fits; treadmill runs quicker than 3:30 a km left out

Each sport’s biggest day.

My longest treadmill run was 42.7 km, a full marathon without leaving the room. Outdoors my longest run was 31.0 km and my longest trail run 34.8 km with 841 m of climb. My longest walk went 30.0 km, and my biggest hike climbed 1,979 m.

FROM THE LOGBOOK

“If you do it, you will feel better when it is over. If you do not, you will feel worse. So go do it.”

CHAPTER 4

04 Records

The far edges. Longest, highest, hardest.

Every record I've set on foot, and how I got there. My longest outings and biggest climbs, the days, weeks and months that went furthest, the milestones, the personal records, the streaks, and the maths of how often a record should break.

THE DISTANCE RECORD

The record broke 14 times.

The longest outing on foot has stood since May 2022.

Every outing I do on foot is up against the longest one before it. My first record was a 5.1 km treadmill run on day one; I reached 10 km on day 2, a half marathon in December 2019, 30 km in August 2021 and 42.7 km on a treadmill on 1 May 2022. In the 1,218 outings since, the nearest I've come is 34.8 km, a trail run.

THE LONGEST OUTING ON FOOT

Every outing on foot, one dot each, by date and distance. The black line is the record of the day: flat while it stands, a step up when it breaks.

Treadmill run · Outdoor run · Trail run · Walk · Hike

Source: Activity Log · distance of every run, walk, trail run and hike

1 · THE LONGEST OUTINGS

Ten outings past 30 km.

Seven of them were on a treadmill.

83 of my outings reached a half marathon (21.1 km) and ten went past 30 km. The seven on the treadmill came between Aug 2021 and Jul 2022. Since then my long days have been outside: a 34.8 km trail run with 841 m of climb, a 31.0 km outdoor run and a 30.0 km walk with 833 m of climb. My biggest day on foot after the marathon was 19 Feb 2025: three outings for 40.6 km.

per outing in 2026

PERSONAL RECORDS, YEAR BY YEAR

How to read it. Every personal record set on foot, counted by year. The tallest year is in orange.

PERSONAL RECORDS PER OUTING

Why it matters. Divided by the outings in each year, the rate shows how often I beat my own past. It's highest now.

Source: Activity Log · personal records (Strava segment bests) on runs, walks, trail runs and hikes

301 days in a row.

The longest streak on record, and still going.

My longest run of days with an outing began on 29 Dec 2025 and I haven't missed a day since: 301 days to 25 Oct 2026. Counted in weeks, I've gone out at least once in 162 weeks in a row, every week since 18 Sep 2023. On foot alone my best is 109 days; running alone 45, walking alone 11. The opposite record is from my early years: 353 days without a single outing, from July 2020 to June 2021.

IN A ROW

301 days
with an outing, still going

162 weeks
with at least one outing

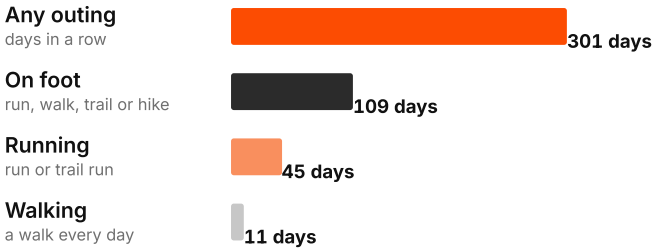

45 days
running in a row

353 days
without one, the longest gap

THE EIGHT LONGEST RUNS OF DAYS

THE BEST STREAK OF EACH KIND

How to read it. Each bar is an unbroken run of days with at least one outing of any kind. The one still going is in orange.

Why it matters. No single sport keeps my streak alive. It holds because my days mix runs, walks and the rest.

Source: Activity Log · consecutive days and weeks with an outing (weeks run Monday to Sunday)

Morogoro owns the climbs.

Twelve of the 20 biggest climbs started there.

Of my 20 biggest single climbs on foot, 12 started in Morogoro, 5 started in Kilimanjaro and 3 started in Manyara. My biggest climb in each region: Morogoro 1,979 m, Manyara 1,718 m, Kilimanjaro 1,037 m, Tanga 614 m, Pwani 597 m and Njombe 367 m.

THE BIGGEST CLIMB IN EACH REGION

How to read it. The single biggest climb that started in each region of Tanzania, coloured by how it was done.

WHERE THE 20 BIGGEST CLIMBS STARTED

Why it matters. My big climbs cluster in a few mountain regions. The rest of my map is flat by comparison.

Source: Activity Log and Strava GPS start points · Tanzania regions

More records than chance.

The distance record broke 14 times. A random order would give 8.0.

If the same outings came in a random order, a record would break about ln(n) + 0.58 times, where n is the number of outings: early on almost anything is a record, later almost nothing is. For my 1,730 outings that is 8.0. My distance record broke 14 times, 1.7 times as often; my runs alone broke theirs 14 times against 7.2. My walks broke theirs 6 times against 7.3, about what chance gives. The present record has stood for 1,218 outings; in a random order the longest outing would sit this early 30% of the time.

RECORDS AGAINST CHANCE

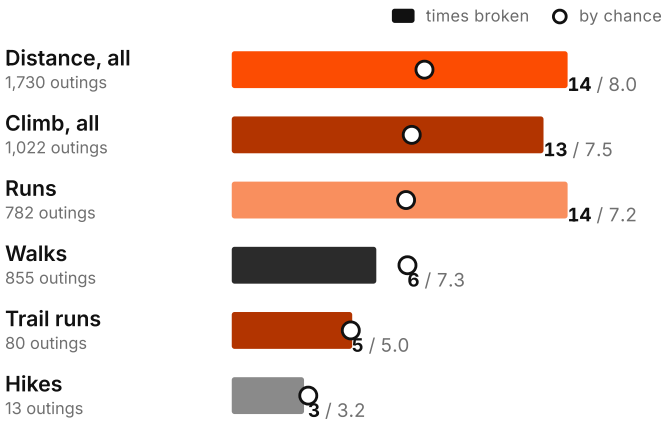

14
times the distance record broke

8.0
times chance would give

1.9×
chance, for runs alone

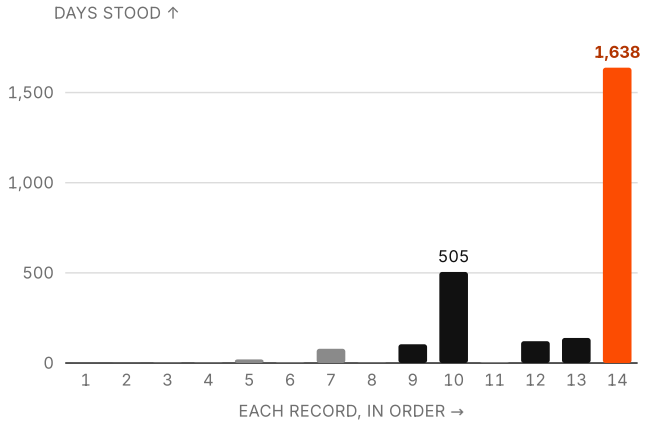

30%
chance the record would stand this long

TIMES EACH RECORD BROKE, AGAINST CHANCE

How to read it. The bar is how many times a record broke. The ring is how many times it would break on average if the same outings were shuffled.

HOW LONG EACH DISTANCE RECORD STOOD

Why it matters. Most of my records lasted days. The longest-lived before the present one stood 505 days, from Mar 2020; the last, in orange, is still standing.

“Something is better than nothing. Do what you can.”

CHAPTER 5

05 Where

Seven countries. Seventeen regions.

Where I went out. Seven countries and seventeen regions of Tanzania, shaded on the map, and what each place gave me: the distance at home, the climb in the mountains, the trips abroad, the years my home base moved and the outings that never left the room.

ACROSS AFRICA

94% began in Tanzania.

Counting every one of my outings with a GPS start.

1,155 of my 2,061 outings carry a GPS start; the other 906 were indoors, on a treadmill or in a gym. Of the ones with a place, 1,082 began in Tanzania and 73 in six other countries: Kenya 32, Malawi 23, South Africa 13, Rwanda 2 and 3 in two countries outside Africa.

THE OUTINGS BY PLACE

3 Other (two countries)
4 km on foot · 71 m up · 3 days
from Apr 2024

How to read it. Darker means more outings, on a log scale so the smaller countries still show. Countries outside Africa are grouped as Other.

17 regions of Tanzania.

Three of them hold 78% of my outings.

Dodoma 375, Dar es Salaam 236 and Kilimanjaro 233 outings, out of my 1,082 in Tanzania. Dodoma leads on outings and on days out (319), and has given me 1,861 km on foot. Kilimanjaro holds 37% of all my climbing in Tanzania, Morogoro 26%. The other thirteen regions share 14% of the outings.

INSIDE TANZANIA

OUTINGS BY REGION

KILOMETRES ON FOOT BY REGION

How to read it. The map shades each region by the measure picked above it. Hover a region for all four measures. Pale grey regions have no outing yet.

Why it matters. The ten busiest regions by outings and by distance. The order barely changes: the same three places carry my record.

Source: Activity Log and Strava GPS start points · Natural Earth region outlines

Two regions do the climbing.

Morogoro and Kilimanjaro hold 29% of my outings and 63% of my climb.

Across Tanzania my outings on foot climbed 13.9 m for every kilometre. In Dodoma it was 6.5 m and in Dar es Salaam 3.5 m: the places where I go out most are the flattest. In Morogoro I climbed 49 m per km and In Kilimanjaro I climbed 21 m per km, and 64 of my trail runs and hikes started there.

METRES CLIMBED FOR EACH KILOMETRE

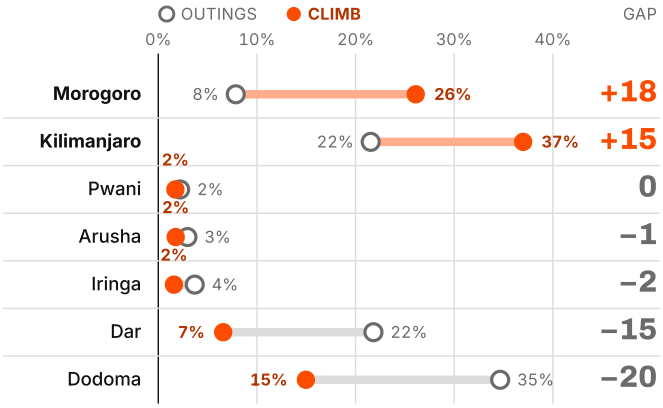

49 m
per km in Morogoro

21 m
per km in Kilimanjaro

6.5 m
per km in Dodoma

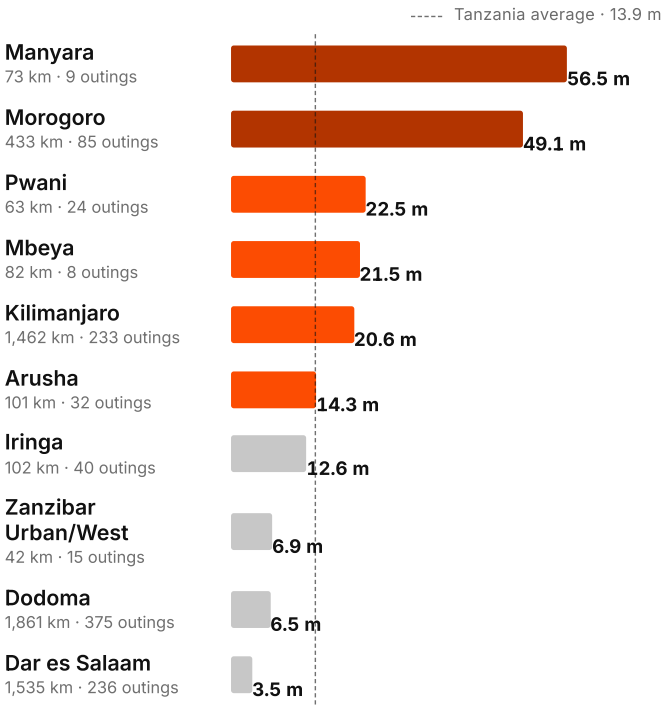

3.5 m
per km in Dar es Salaam

SHARE OF THE OUTINGS AGAINST SHARE OF THE CLIMB

How to read it. The grey ring is a region's share of the outings, the orange dot its share of the climb. Rows run from the biggest climb surplus to the biggest shortfall.

METRES CLIMBED PER KILOMETRE, BY REGION

Why it matters. Each region's climb divided by its distance on foot. Past the dashed line, a kilometre there climbs more than the Tanzanian average.

Source: Activity Log and Strava GPS start points · climb and distance on foot

Dodoma led for four years.

Every year from 2021 to 2024. Then the lead moved.

2021: Dodoma, 104 of 160; 2022: Dodoma, 83 of 212; 2023: Dodoma, 57 of 175; 2024: Dodoma, 55 of 126; 2025: Kilimanjaro, 65 of 190; 2026: Dar es Salaam, 107 of 207. Dar es Salaam leads 2026 so far with 52% of my outings in Tanzania. The number of regions I went out in moved too, from 7 in 2021 to 12 at the widest.

13
regions still blank

REGIONS WITH AN OUTING, ADDING UP

How to read it. The line steps up each time I start an outing in a region for the first time. The first and the newest are named.

NEW REGIONS EACH YEAR

Why it matters. New regions come in bursts, when I travel. 2026 so far has added three.

Source: Activity Log and Strava GPS start points · first outing in each region

73 outings abroad.

Kenya has 32 of them.

Kenya came first, in July 2020; my first outing there on foot was in December 2022, and the latest in April 2026. In Malawi I logged 23 outings over 19 days between Oct 2024 and Dec 2024. In South Africa I logged 13 in 8 days and set 11 personal records. Three more outings came in two countries outside Africa.

OUTSIDE TANZANIA

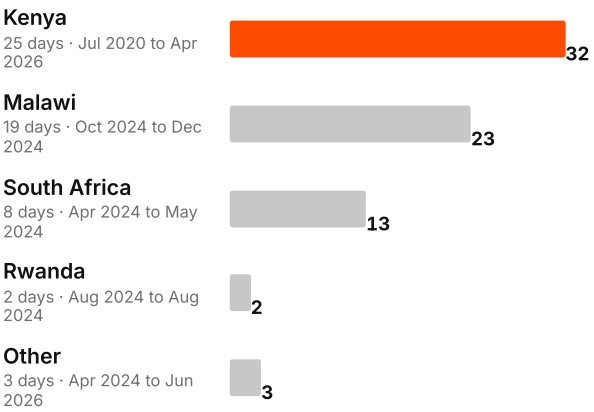

73 outings abroad

6 countries

184 km on foot abroad

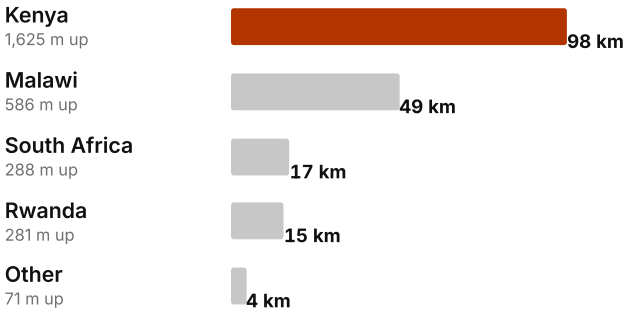

57 days out abroad

OUTINGS IN EACH COUNTRY

How to read it. Every outing with a GPS start outside Tanzania, by country. Countries outside Africa are grouped as Other.

KILOMETRES ON FOOT IN EACH COUNTRY

Why it matters. My trips abroad were short. The most days I went out in any one country was 25, in Kenya.

Source: Activity Log and Strava GPS start points · outings outside Tanzania

Fewer outings without GPS.

My outings with no GPS start fell from 85% in 2019 to 34% in 2026.

906 of my outings have no start point: they happened indoors, on a treadmill, a gym floor or a physio table. 646 of them were runs on the treadmill. In 2019 they were 85% of the year; no year since has had a bigger share, and 2026 so far is down to 34%.

OUTINGS WITH NO GPS START

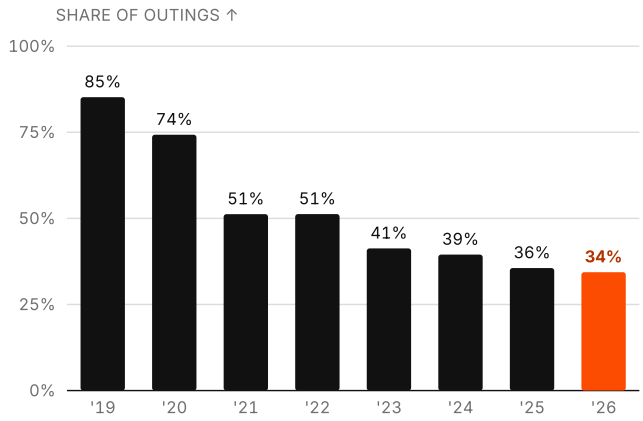

906
outings in all

646
treadmill runs

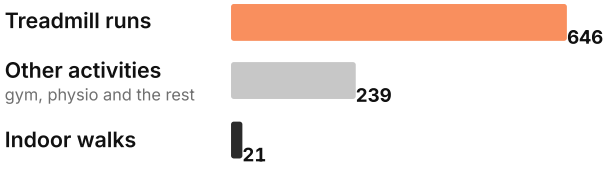

85%
of 2019 outings

34%
of 2026 outings so far

SHARE OF EACH YEAR WITH NO GPS START

WHAT THE OUTINGS WITH NO PLACE WERE

How to read it. Each bar is the share of that year's outings that carried no GPS start and so have no place on the map.

Why it matters. The maps above show only the outings that went outside. My treadmill years are mostly missing from them.

Source: Activity Log · outings without a GPS start point

How widely they spread.

In 2023 my outings spread like 4.5 equal regions. In 2021, like 2.2.

The effective number of regions asks how many equally busy regions would give the same spread: one over the sum of each region's squared share of the outings. Seventeen regions with one doing almost everything count as close to one; four regions with a quarter each count as four. My narrowest year since the habit began was 2021 at 2.2, when Dodoma held 65% of my outings. The widest was 2023 at 4.5. Over my whole record the outings behave like 4.5 regions, and the busiest three hold 78%.

HOW THE OUTINGS SPREAD

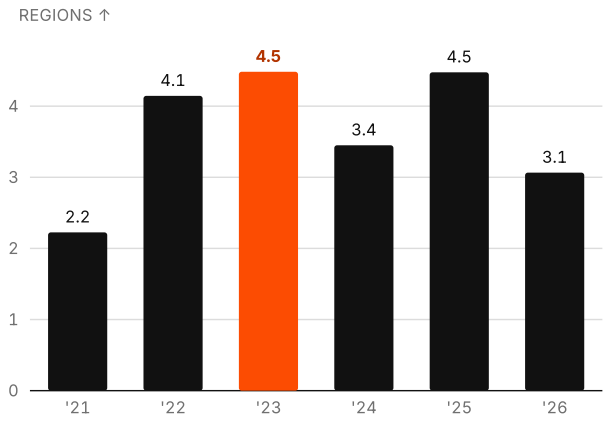

4.5
effective regions, all years

4.5
in 2023, the widest

2.2
in 2021, the narrowest

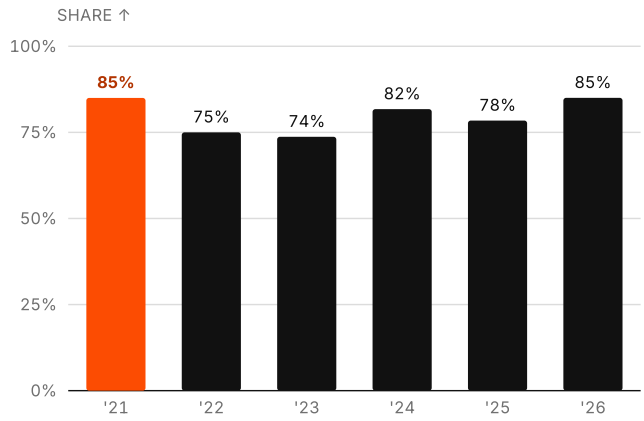

78%
of outings in the busiest three

EFFECTIVE NUMBER OF REGIONS, YEAR BY YEAR

How to read it. Taller means the year's outings were spread over more regions. Years with fewer than 50 outings in Tanzania are left out.

SHARE OF THE OUTINGS IN THE TOP THREE REGIONS

Why it matters. The same story from the other side: the higher the bar, the more that year leaned on three places.

Source: Activity Log and Strava GPS start points · inverse Simpson index of outings by region

FROM THE LOGBOOK

"Taking ownership of your life is not easy, and living a life of discipline is not easy. In fact, it is hard. That is why it works."

IV

The long view

Everything in the order it happened, and the targets I hold every year against.

06 **Timeline** 07 **Goals**

CHAPTER 6

06 Timeline

In order. First upload to now.

My whole record in the order it happened, drawn as one chronicle: the milestones, the firsts, the trips abroad and the new regions, every pair of shoes, and the streaks and silences. Then every moment written out, year by year.

AUG 2019 TO OCT 2026

The silence never came back.

After my 353-day silence, no break has lasted more than ten days.

My record opens on 17 Aug 2019, and I logged 62 outings in its first 11 months. Then I went quiet from July 2020 to June 2021. Since I came back, the longest gap between two of my outings has been ten days, and my current streak has run 301 days since 29 Dec 2025. Along the way: 10 firsts on foot, 6 countries outside Tanzania, 17 regions of Tanzania and 11 pairs of shoes.

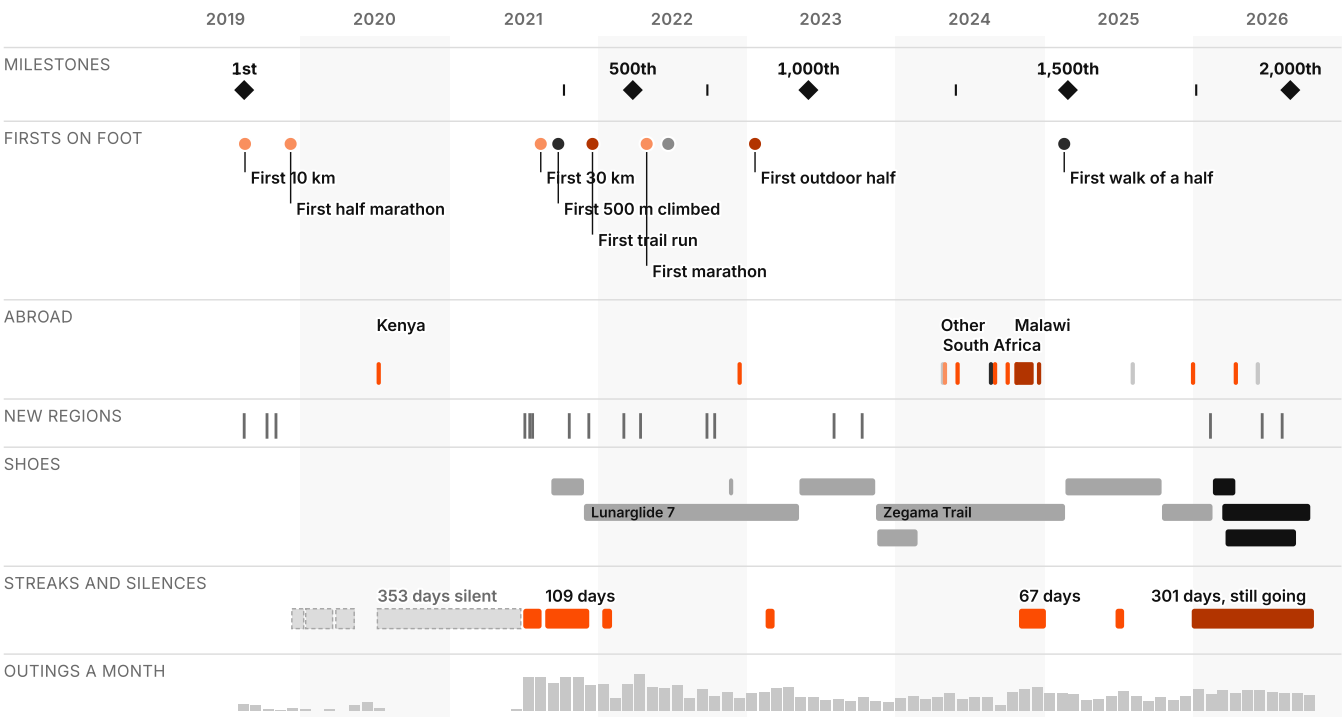

THE RECORD IN TIME

2,627 days
from the first outing to the latest

2,061
outings in that time

353 days
the silence, Jul 2020 to Jun 2021

▬ 20 days or more in a row ▭ 30 days or more without an outing

Source: Activity Log, Strava GPS start points and the shoe list · every dated moment in the record

1 · THE PACE

The first 250 took 785 days.

Every 250 since has taken under a year.

My 250th outing came on 10 Oct 2021, 785 days after the first, with the silence inside that stretch. Since then each block of 250 has taken me between 169 days (to the 500th, Mar 2022) and 362 days (to the 1,250th, May 2024). My breaks shrank with it: the longest each year fell from 353 days in 2020 to no break at all in 2026 so far.

EVERY 250 OUTINGS

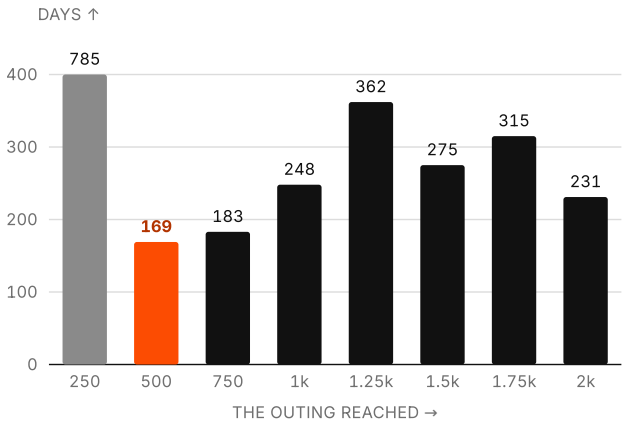

785 days
to the 250th

169 days
the quickest 250, to the 500th

362 days
the slowest since, to the 1,250th

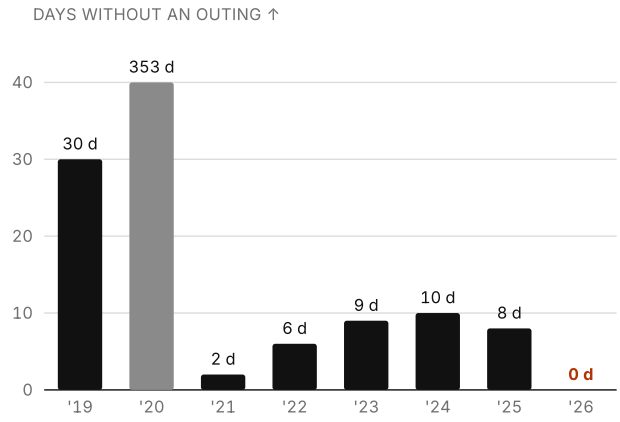

231 days
to the 2,000th, the latest

DAYS TO EACH 250 OUTINGS

How to read it. Each bar is the days it took to add 250 outings. The first bar, in grey, holds the silence and is cut at 400.

THE LONGEST BREAK EACH YEAR

Why it matters. The longest stretch without an outing in each year. Bars that run off the top (in grey) are the early years; since my habit began the longest has been ten days.

Source: Activity Log · dates of every 250th outing and of every gap between outings

Ten firsts on foot.

From a 10 km on day 3 to a 30.0 km walk in 2025.

The first 10 km in Aug 2019, the first half marathon in Dec 2019, the first 30 km in Aug 2021, the first 500 m climbed in Sep 2021, the first trail run in Dec 2021, the first marathon in May 2022, the first 1,000 m climbed in Jun 2022, the first hike in Jun 2022, the first outdoor half in Jan 2023 and the first walk of a half in Feb 2025. The treadmill gave me the early distance firsts; the trails, the mountains and the long walks gave me the later ones.

FIRSTS ON FOOT

10
firsts on foot

3
day of the first, first 10 km

3
in 2021, the most in a year

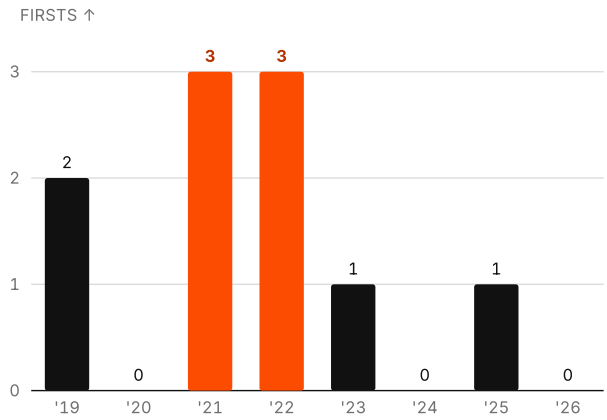

2,014
day of the latest, first walk of a half

HOW LONG EACH FIRST TOOK

How to read it. Each bar runs from the first outing on record to the day the first came, coloured by how it was done.

FIRSTS EACH YEAR

Why it matters. My firsts cluster in the early habit years and then thin out: each new one needs a longer day or a steeper hill.

FROM THE LOGBOOK

“Ease is a greater threat to progress than hardship.”

DENZEL WASHINGTON

CHAPTER 7

07 Goals

The targets, year by year.

My goals, the ones I've met and the ones still open. Three targets I hold against every year, the odds that the last open ring closes this year, one race run four times, fifty trips to one headland, and a run of months that never went empty.

THREE TARGETS, EVERY YEAR SINCE 2021

Both 1,000 km rings closed.

2026 is the first year I've closed both. My climbing ring is at 80%.

I hold the same three targets against every year: 1,000 km walked, 1,000 km run (treadmill, road and trail) and 24,000 m climbed on foot. I've closed the running ring four times, in 2021, 2022, 2023 and 2026, and the walking ring once, on 10 Sep 2026. The climbing ring has never closed; my best year was 2023 with 21,490 m. With 67 days of 2026 left, I need 4,752 m more of climbing.

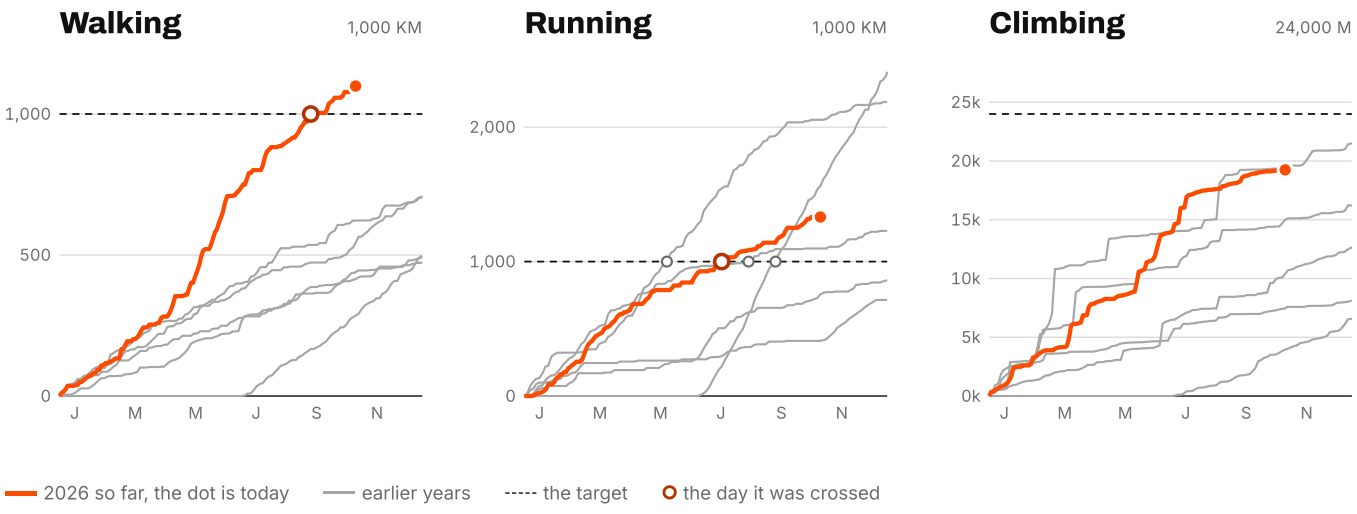

2026 SO FAR

1,099 km
walked, 110% of the target

1,331 km
run, 133% of the target

19,248 m
climbed on foot, 80% of the target

67 days
left in 2026

Source: Activity Log · daily totals on foot, running total through each calendar year

Running closed four times.

My walking ring closed once. My climbing ring never has.

My running ring closed on 10 Sep in 2021, 24 May in 2022 and 14 Aug in 2023. In 2021 I ran 2,412 km, 2.4 times the target. Then 2024 and 2025 fell short, at 714 km and 859 km. My walking stayed under 800 km a year until 2026, when I crossed 1,000 km on 10 Sep 2026. The climbing ring came closest in 2023, at 90%.

RINGS CLOSED, 2021 TO 2026

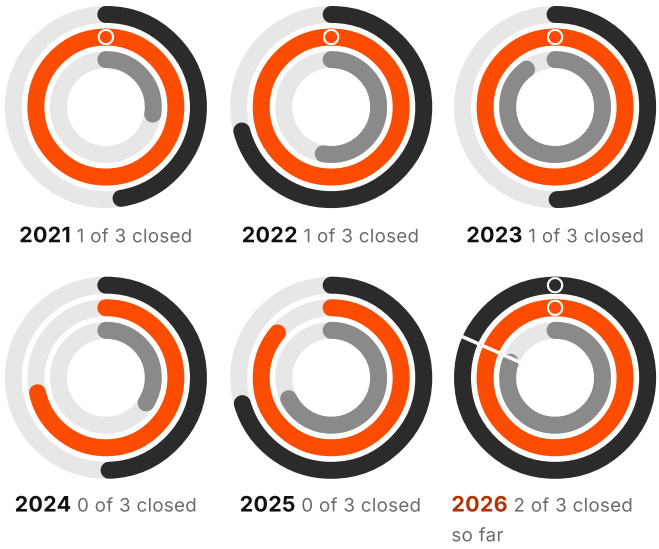

4
running, best 2,412 km in 2021

1
walking, best 1,099 km in 2026

0
climbing, best 21,490 m in 2023

1
years with both 1,000 km rings closed

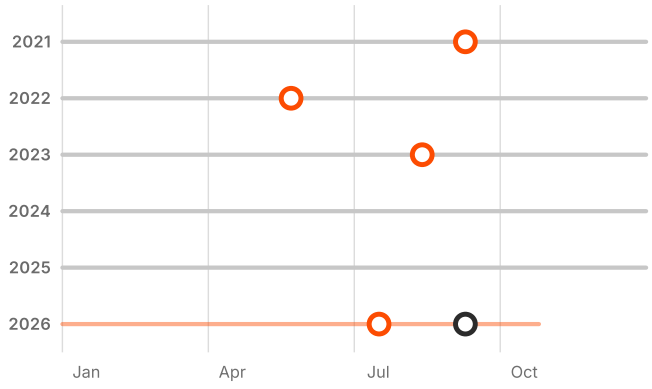

EACH YEAR AS THREE RINGS

● outer ring, walking 1,000 km ● middle ring, running 1,000 km
● inner ring, climbing 24,000 m

How to read it. Each ring fills to its share of the target and a dot seals a closed ring. On 2026, the white notch is where the year stands today.

THE DAY EACH RING CLOSED

Why it matters. A ring on the line is the day a target fell; the earlier, the bigger the year. Targets never met are listed with their share at the row's end.

Source: Activity Log · yearly totals on foot against the three fixed targets

Climbing: a 33% chance.

The odds that my climbing ring closes in 2026.

To close it, I need 4,752 m in the last 67 days: 71 m a day. So far this year I've averaged 65 m a day, rest days included, so the average alone says I close it just short. To put odds on it, I replay the rest of the year 4,000 times, each time picking 67 days at random from my 298 days of 2026 so far and adding up their climb. 33% of those replays pass 24,000 m; the middle one finishes at 23,459 m. The warning sign is my recent pace: since 1 August it has been 22 m a day, and at that rate my year ends near 20,700 m.

THE CLIMB, 2026

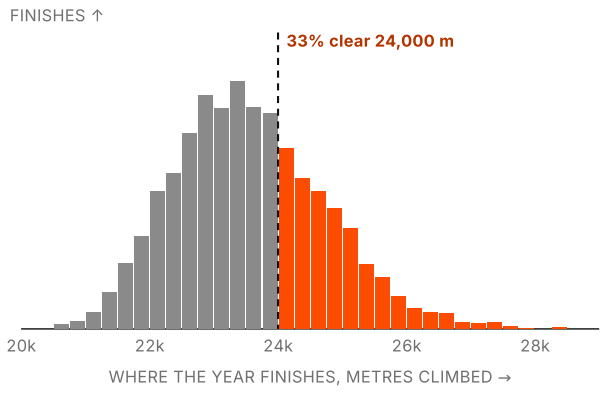

4,752 m
still to climb in 67 days

71 m
a day needed from here

65 m
a day so far in 2026

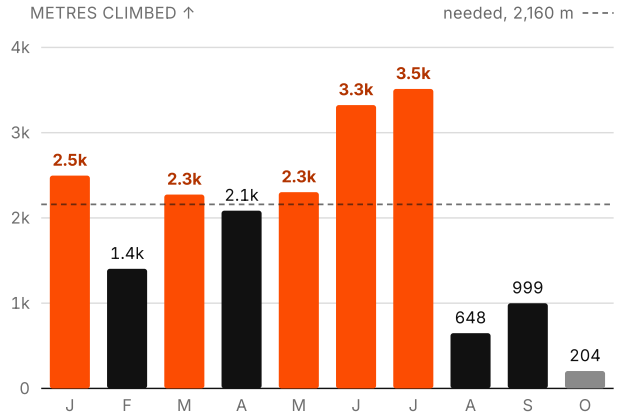

33%

WHERE 4,000 REPLAYS OF THE YEAR FINISH

How to read it. Each bar counts the replays that finish in that 250 m band. Orange bars clear the target, the dashed line.

METRES CLIMBED EACH MONTH OF 2026

Why it matters. Orange months beat the pace my ring now needs. 5 of 9 full months did; October, in grey, is still going.

Source: Activity Log · climb on foot each day of 2026, resampled 4,000 times with a fixed seed

Quicker every year.

My Kilimanjaro Half, four times on record.

The same half marathon, four times on record. My moving time went 4:00 in 2023, 3:43 in 2024, 3:42 in 2025 and 3:38 in 2026, 23 minutes quicker from first to last. My stops shrank faster than my running: 32 minutes standing still in 2023, 6.5 in 2026. If I race them side by side, when my 2026 self crossed the line, my 2023 self was still 2.1 km out. Each time I set 18 personal records on the course's timed segments. The 2023 race drew 125 kudos, the most of any outing I've logged.

FOUR EDITIONS OF ONE RACE

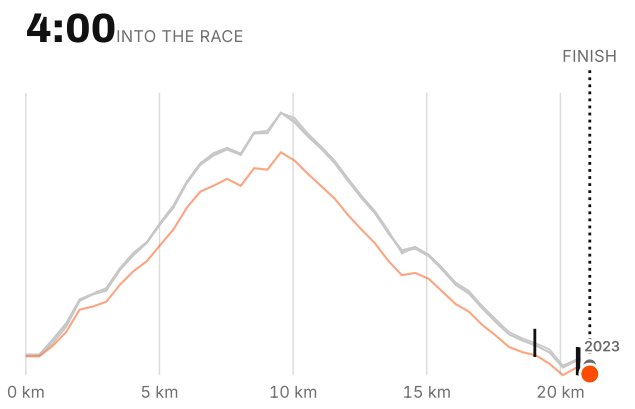

22.6 min
quicker in 2026 than in 2023

26 min
less time stopped than in 2023

2.1 km
2023 behind when 2026 finished

125
kudos in 2023, the most of any outing

ALL FOUR EDITIONS, RACED AT ONCE

2026	2025	2024	2023
3:38	**3:42**	**3:43**	**4:00**
the quickest	0.4 km behind when 2026 finished	0.5 km behind when 2026 finished	2.1 km behind when 2026 finished

How to read it. The line is the course from start to finish, drawn by its height; each dot runs it at my pace in that year, half a kilometre at a time. Ticks mark where the others were when the quickest finished.

MOVING AND STOPPED, EACH EDITION

Why it matters. The solid bar is time moving and the hatched end is time stopped. Of the 48 minutes saved on the course, 53% came off the stops.

Source: Kilimanjaro Half table and course profile · moving pace per half kilometre, elapsed and moving time per edition

Fifty trips to Ras Kilomoni.

In 173 days. The last one took my record to 2,000 outings.

In 2026 my target was a place: reach the headland at Ras Kilomoni fifty times, numbering the trips I to L as I went (Roman numerals, 1 to 50). It took me from 9 Mar 2026 to 28 Aug 2026: 34 trips at a walk and 16 on the run, 535 km in all. June was my busiest month with 14. The last trip, L, took my whole record to 2,000 outings.

RAS KILOMONI

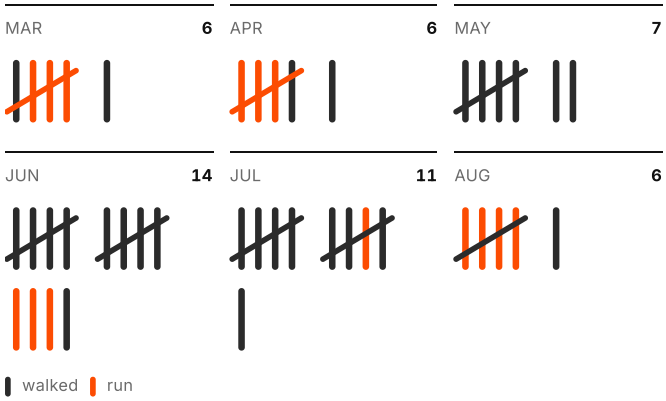

50
trips, the target met exactly

EVERY TRIP, KEPT AS A TALLY

How to read it. One stroke per trip, counted in fives the way a tally is kept by hand: four upright, the fifth across. Orange strokes I ran, grey ones I walked.

TRIPS EACH MONTH

Why it matters. My count was steady through the first three months, then June took 14 trips and the target came within reach.

Source: Ras Kilomoni table · every trip with its date, sport and distance

65 months in a row.

I went out in every one of them. 49 months passed 100 km on foot.

This one was never one of my three targets. My last calendar month without a single outing was May 2021; every month since, 65 in a row, has had at least one. 49 of my months have passed 100 km on foot, the first in July 2021. In 2026 every month so far has, ten of ten.

EVERY CALENDAR MONTH

FROM THE LOGBOOK

“I wanted to show that it is beautiful to be strong, to have drive, to have will, to not fail, to give it your all.”

KERSTIE ENNIS

V

The lessons

What I think seven years of logs taught me.

CHAPTER 8

08 What It Means

What the numbers say to you.

What seven years of logs taught me, in my own words. Each lesson comes with the numbers behind it: what the habit costs in time, why I count days before kilometres, the small days, the weekly floor, how long days arrive, and the maths of a year.

SEVEN YEARS, READ BACK

71 minutes a day.

That is what this has cost me since 2021. This year it costs 106.

If you ask me what all of this costs, the answer is time. Since the habit started in 2021 I've spent 71 minutes a day on the move, and that average counts the rest days too. Add up every outing since the first upload and it comes to 2,382 hours, the same as 99 days and nights without stopping. This year it jumped to 106 minutes a day, and I've been out on every one of the 298 days so far. The rest of this page is what I think that time taught me, with the numbers behind each point.

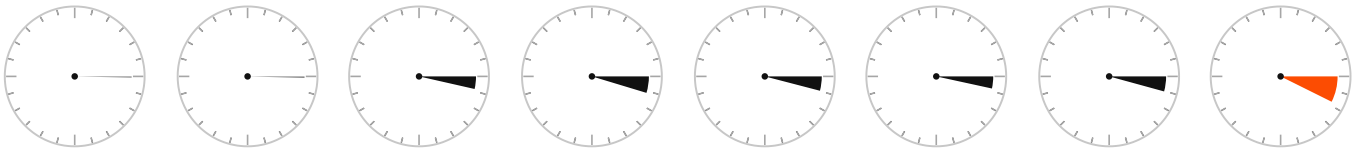

WHAT IT COST

2026 SO FAR

The circle is one day of 24 hours. The wedge is the minutes on the move per day, rest days included.

Source: Activity Log · moving time of every activity, spread over every calendar day

The days held. The km fell.

In my slowest year the distance fell by 58%. My days out fell by 12%.

2022 was my biggest year for distance: 2,907 km on foot over 266 days. By 2024 I was down to 1,214 km. The long days went first: 37 days of 21 km or more in 2022, four in 2024. The days out barely moved, 266 to 234. That's the part I'd protect if I could only keep one thing. When the distance came back in 2026 it had something to build on: 2,430 km so far, with an outing on all 298 days.

2022 AGAINST 2024

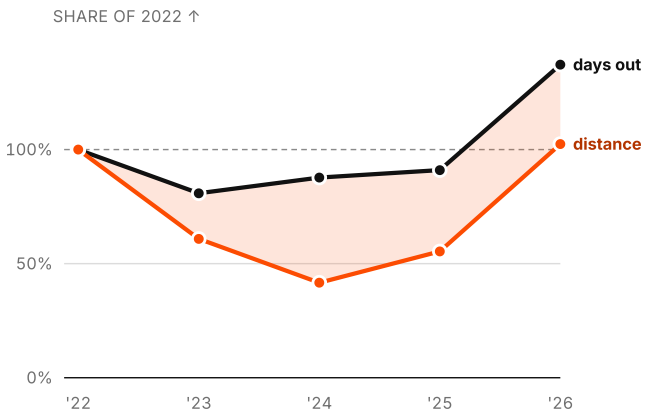

58%

4 days
of 21 km or more in 2024, from 37

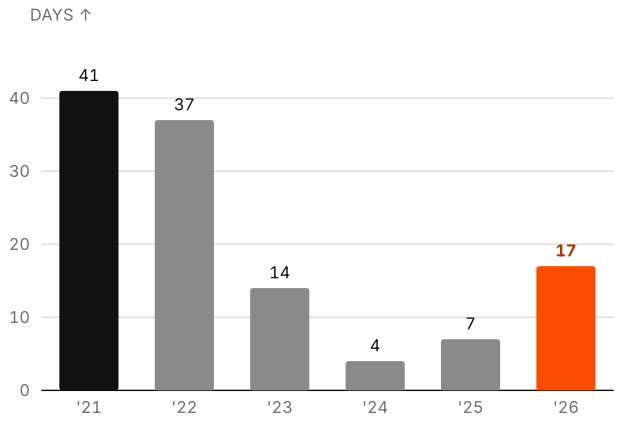

298 of 298
days out in 2026 so far

DAYS OUT AND DISTANCE, AGAINST 2022

How to read it. Both lines start at 100% in 2022. The ink line is the share of days with an outing; the orange line is the distance on foot per calendar day. The shaded gap is how far the distance fell behind the days.

DAYS OF 21 KM OR MORE ON FOOT

Why it matters. The long days carry the distance. They fell from 41 in 2021 to 4 in 2024, and 2026 is back to 17.

Source: Activity Log · days with any activity, and distance on foot, per calendar year

The small days count.

One day out in six was barely anything. Those days kept the habit going.

Since 2021 I've had 1,435 days out, and on 246 of them I covered less than 2 km on foot. 85 were a short walk, 82 a gym session, 40 a ride and 35 a physio session, plus four others. Together they add 96 km, under 1% of my distance, and that's fine. They're there for the days I'd otherwise skip, and it shows the next morning: after one of those small days I was out again 76% of the time. After a full rest day it was 50%. They peaked in 2024 at 68, the same year my distance was lowest. On a bad day, I do the small version.

SMALL DAYS SINCE 2021

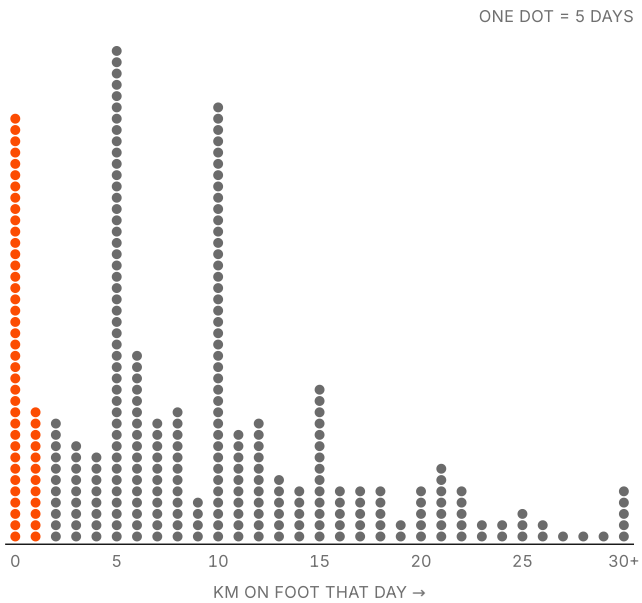

246 days
under 2 km on foot

17%
of all my days out

76%
out again the next day

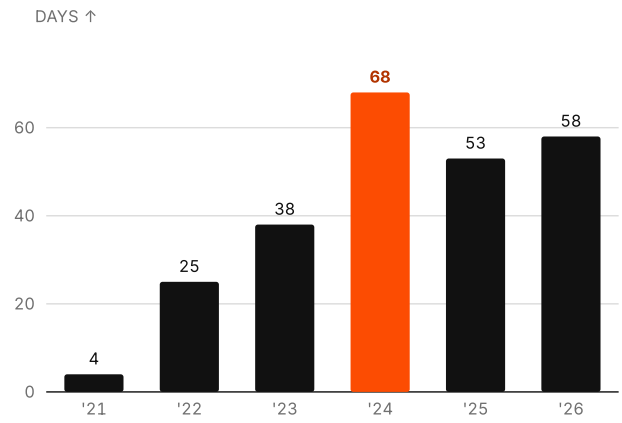

50%
out again after a full rest day

EVERY DAY OUT SINCE 2021, BY ITS DISTANCE

How to read it. Each dot is five days out, stacked by how far I went on foot that day. The orange dots on the left are the days under 2 km; a day with only a gym session or a ride counts as zero.

DAYS UNDER 2 KM EACH YEAR

Why it matters. The small days rose as the distance fell. 2024 had the most of them and the least distance, and the habit still held.

Source: Activity Log · every day with an activity since the habit began, distance on foot only

No week under 20 km.

That is 2026 so far. From 2022 to 2025, 38 weeks fell under 10 km.

Look at my weeks and the best ones aren't the story. My biggest week of 2022 was 148 km and this year's is 153 km, about the same. The difference is at the bottom. From 2022 to 2025 I had 38 weeks with less than 10 km on foot. In 2026 the lowest is 20 km, and the middle half of my weeks sits between 41 and 72 km. The first half-year of the habit had a floor too: no week in 2021 went under 40 km. With the same top and a higher floor, 2026 is my best year for distance per day, 8.2 km. Raise the floor and the year looks after itself.

WEEKS ON FOOT

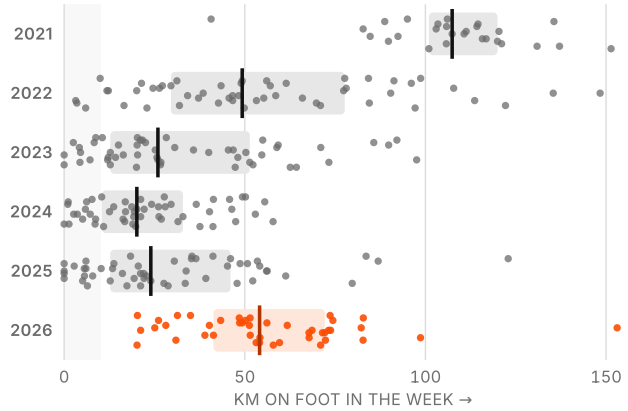

20 km
my lowest week of 2026

0 weeks
under 10 km in 2026

38 weeks
under 10 km, 2022 to 2025

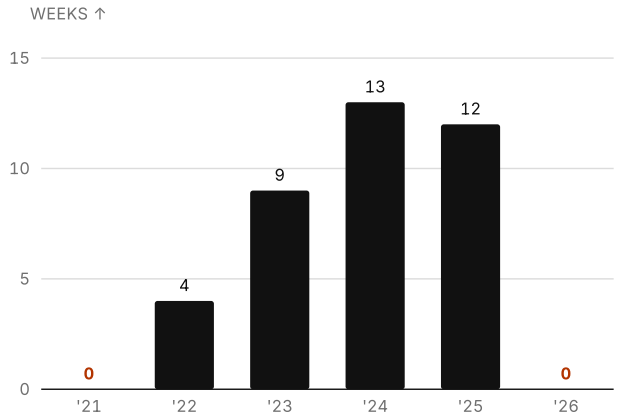

8.2 km
a day in 2026, the most of any year

EVERY FULL WEEK, BY ITS DISTANCE

How to read it. One dot per full week, Monday to Sunday. The shaded band holds the middle half of the weeks, the tick is the median week, and the grey strip on the left is under 10 km.

WEEKS UNDER 10 KM EACH YEAR

Why it matters. The bars at zero are the years with a floor: the first half-year of the habit and 2026. Every year between let some weeks slide.

Source: Activity Log · distance on foot per full week since the habit began

Long days come in bunches.

The day after one averages 13.2 km, double a normal day.

Since 2021 I've had 120 days of 21 km or more on foot, half-marathon distance and up. 108 of them, 90%, were followed by another day out, and that next day averaged 13.2 km against 6.6 km on a typical day. The three days before a long day were big too. So a long day sits inside a big block of training, with big days on both sides of it. Long runs work the same way: after a run of 15 km or more, I ran again the next day 71% of the time and took a full rest 11% of the time.

DAYS OF 21 KM OR MORE SINCE 2021

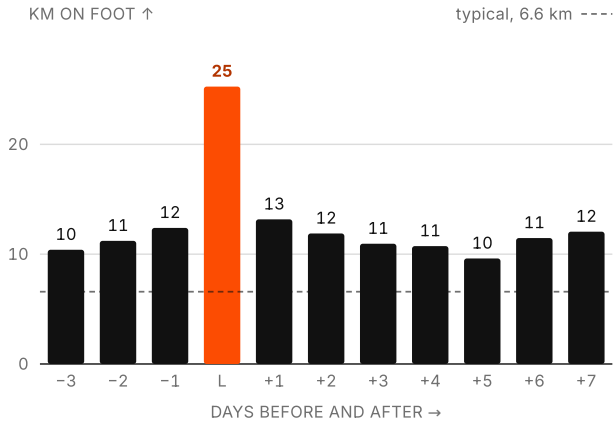

120 days
of 21 km or more on foot

90%
followed by another day out

13.2 km
the next day, against 6.6 km on a typical day

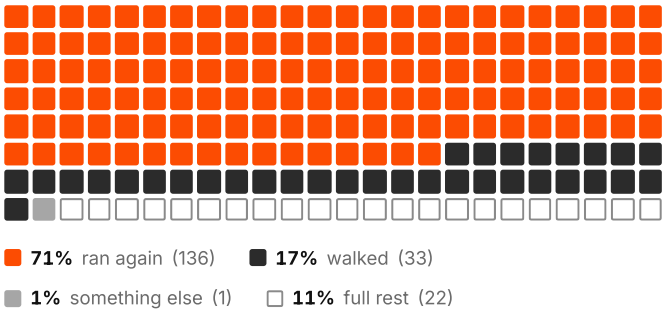

11%
full rest after a 15 km run

THE DAYS AROUND A LONG DAY

How to read it. The orange bar is the average long day. The bars either side are the same days of the calendar, three before and seven after, and the dashed line is an ordinary day.

WHAT CAME THE DAY AFTER A 15 KM RUN

Why it matters. One square per run of 15 km or more, coloured by what I did the next day. Most of the time I got straight back on it; part of that is the season, since long days live in big months.

Source: Activity Log · days of 21 km or more on foot and runs of 15 km or more since the habit began

Two levers make a year.

How many days I go out, and how far I go each day.

Every yearly total is days out times distance per day out. 1,000 km is 2.7 km a day if you go every day, or 4.1 km a day out if you go two days in three. I've pulled both levers. 2021 was the long-days year: 16.0 km per day out, on 49% of days. 2026 is the every-day year: 8.2 km on 100% of days. 2024 was low on both, 64% of days at 5.2 km, and landed at 1,214 km. The curves on the chart are yearly totals, so you can see which lever lifted each year.

THE TWO LEVERS

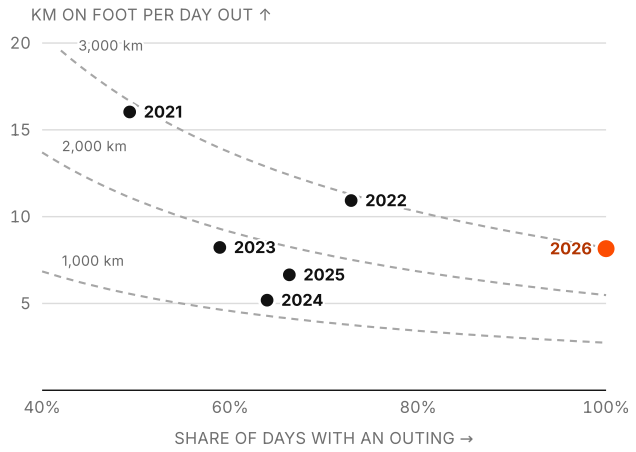

2.7 km
a day makes 1,000 km a year

16.0 km
per day out in 2021, the longest

100%
of days out in 2026 so far

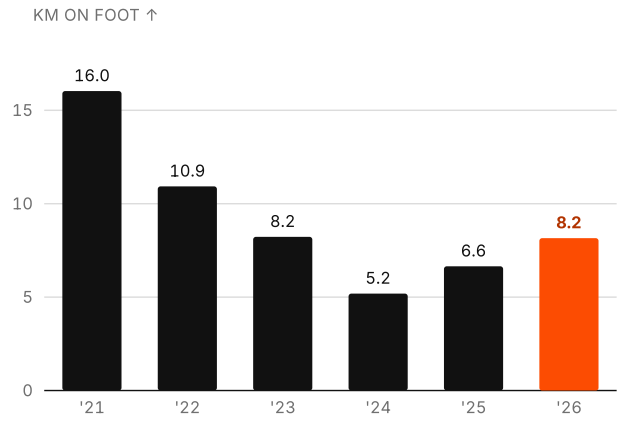

1,214 km
in 2024, low on both

EACH YEAR BY ITS TWO LEVERS

How to read it. Across is the share of days with an outing, up is the distance per day out. Each dashed curve is one yearly total; a year above a curve beat it.

DISTANCE PER DAY OUT

Why it matters. From 2021 to 2024 the distance per day out kept falling while the days out held or grew. 2026 found a middle: more distance per day out than 2024, and far more days.

Source: Activity Log · days with any activity and distance on foot per calendar year

If you're starting out.

Four things I'd tell you.

COUNT THE DAYS

234 days

out in 2024, my lowest year for distance

12% FEWER THAN 2022

DO THE SMALL VERSION

246 days

under 2 km that kept the habit going

76% OUT AGAIN THE NEXT DAY

GUARD THE FLOOR

20 km

my lowest week of 2026

NO WEEK UNDER IT

BUILD IN BLOCKS

13.2 km

the day after a long day, on average

A TYPICAL DAY IS 6.6 KM

That's what seven years of logs say to me. The big numbers on the other pages came out of small habits: about an hour a day, a short version on the bad days, a weekly floor, and long days built inside big weeks. There are 67 days of 2026 left. I'll be out tomorrow.

FROM THE LOGBOOK

"Break the long challenges into increments, things you can do right now that add up over time."

DAN CNOSSEN

Epilogue

The last activity in this edition is from 25 October 2026. My streak stands at 301 days, and the habit that started in 2021 has now run for 1,947 days.

None of the totals in this book came from one big effort. They came from 2,061 ordinary outings, most of them short, fitted in early in the morning or in the evening, on days that looked like any other. The record will keep growing after this edition, one day at a time, and the next edition will carry the new numbers.

I'll be out tomorrow.

Gerald Tesha

ANNEX A

How this book was made

This book started as a website, My Strava Journey: my Strava history laid out so anyone can read it. Nothing in it is typed in by hand. Every figure is computed from my activity log, and the log is refreshed every week.

Each week I pull my latest activities from Strava through an MCP server. MCP, the Model Context Protocol, is an open standard that lets an AI assistant connect to outside tools and data; here it connects to my Strava account and returns every activity as one raw CSV file.

From that file a set of Python scripts rebuilds everything: the activity log, the totals on foot, the places, the streaks, the records and the tables behind each chart. A privacy pass removes activity names, Strava IDs and exact GPS points before anything is published. Then the checks run, and the site goes live with the new numbers. This edition holds 2,061 activities, up to 25 October 2026.

I built it with Claude, Anthropic's AI model, as a coding and analysis partner. I set the questions, the design and the voice; Claude wrote the code, mined the data and checked each number against the log before it went into the text.

DATA SOURCE	My Strava activity history, pulled weekly through an MCP server
PIPELINE	Python, standard library only: rebuild, foot-only totals, derived tables, privacy pass
DATA STORE	32 CSV tables, the single source of truth for every number
SITE	React 18 and Vite 5, React Router with hash links, PapaParse to read the CSVs
CHARTS	Drawn by hand in SVG and canvas, without a chart library
TYPE AND COLOUR	Archivo and Inter on a Swiss grid, one accent colour, Strava orange, kept for data
QUALITY	Data validation, tests, an axe accessibility audit and layout checks at phone widths
HOSTING	GitHub Pages, from the repository github.com/hpgerald/my-strava-journey
BOOK	The site printed through headless Chromium to an A4 PDF

The weekly pipeline

01 Strava
Every outing I record lands in my Strava account.

02 MCP pull
Each week the latest activities come out through an MCP server, as one raw CSV.

03 Build
Python scripts rebuild the activity log and every table derived from it.

04 Privacy
Names, Strava IDs and exact GPS points are removed. Places stay at country and region.

05 Checks
Encoding, data rules, tests, accessibility and phone layouts are checked.

06 Site
The React site reads the tables in the browser and draws every chart live.

07 Book
The same pages print as this book, and a fresh PDF is made with each refresh.

ANNEX B

About the data

Where the numbers come from

Every activity comes from my Strava export: date and time, sport, distance, moving and elapsed time, climb, heart-rate effort, kudos and personal records. Places come from each activity's GPS start point, kept only to country and region.

Distance and climb count the four sports on foot: runs, walks, trail runs and hikes. Rides, the gym and everything else count as outings and days out, but add no distance or climb.

A treadmill session is one Strava marks as a trainer session. Those have no GPS, so they never appear on a map and set almost no segment records.

Relative Effort	Strava's measure of how hard a session was, from heart-rate time-in-zone. Higher means more cardiovascular strain.
Kudos	A thumbs-up from another Strava athlete, the platform's version of a like.
PR	Personal Record: a best-ever time over a segment or standard distance.
Achievement	A Strava badge earned on a segment (for example a top-10 or a personal best).
Elevation gain	Total metres climbed over an activity, summed over every uphill section.
Moving time	Time spent actually moving, with auto-pauses removed. Elapsed time includes stops.
Trainer	An indoor session (treadmill or stationary trainer) flagged by Strava; these carry no GPS.

THE AUTHOR
